Architectural Description

This two story, single wall building is distinguished by its centered, two story portico which is supported by square, paneled columns on the first story and has a second story balcony. It sits on a concrete slab foundation and has a composition shingled, front facing, gable roof with overhanging eaves with exposed rafter tails. Gable roofed dormers are on either side, and a shed roof projects off the Diamond Head (east) side and shelters a lanai on that side of the building. The walls are of vertical tongue and groove with a 2" x 6' girt running around the building at the mid-point of the windows. The windows are 2 x 2 double hung sash. The portico has a front facing gable roof with a rectangular wood slat ventilator in its gable end. The portico's balcony has a solid tongue and groove railing with the name of the society written in Chinese.

The On Tong Tung Heong Society is comprised of members of the Lum clan who originally came from On Tong village in China.

Architectural Description

This modest cottage sits on a lava rock foundation and has a composition shingled hipped roof with over hanging eaves and exposed rafter tails. It is single wall, with vertical tongue and groove walls with a girt at the windows; mid-point. The windows are jalousie. The house features a centered porch protected by an overhang of the main roof, supported at its outer corners by square columns. Concrete steps approach the porch from the left, running parallel to the façade. To either side of the porch are a pair of jalousie windows.

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This L-shaped cottage sits on a post and pier foundation and has a composition shingled, intersecting hipped roof. The house is single walled with vertical tongue and groove walls with two narrow girts running just above the windows' sill line. The windows are 1 x 1 double hung sash. A shed roofed carport has been placed in the intersection of the L. At the rear of the carport, concrete steps, running parallel with the base of the L lead up to a front door. Its wrought iron railing remains intact.

Architectural Description

This two story, residence faces Ewa (west). It sits on a concrete slab foundation and has a composition shingled, intersecting hipped roof with overhanging eaves and exposed rafter tails. The walls are of CMU block on the first story and on the second, vertical tongue and groove with two narrow girts running at the mid-point of the windows. The house is L-shaped with a 12' x 18' wing projecting from the left side of the façade. A straight run of wood steps runs parallel to the façade to the house's front entry. The second story entry is in the main body of the house at the intersection of the L and a picture window is to its right. The picture window is between two 1 x 1 double hung sash windows. A shed roofed coping runs between the first and second stories, and an entrance to the first story is under the steps. All windows, other than the picture window are 1 x 1 double hung sash.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

Developed under the auspices of the Honolulu Redevelopment Agency as low income housing, this apartment complex is three stories in height with built-up, shed roofs and plastered concrete walls. It is comprised of contiguous, H shaped buildings, which contain approximately 120, three and four bedroom dwelling units. Following a modified version of the perimeter block plan, the complex is arranged around two large uncovered, paved parking lots which are surrounded by the buildings on three sides. There are three buildings on both the *makai* (ocean) and *mauka* (mountain) sides of the parking lots and one building at one end, resulting in two U-shaped sets of buildings, back-to-back. However, the H shaped buildings do not always align, thus instilling a modicum of variety in the context of uniformity. A single story CMU office building stands on a raised pavilion between the two U shaped groupings. Each H-shaped building has one elevation dominated by the individual units' lanai which constitutes the entire wall, while the opposite wall is solid except for the floor-to-ceiling jalousie windows located at the ends of the walls.

This complex is a contributing feature to the potential Kauluwela Redevelopment Area Historic District.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

Developed under the auspices of the Honolulu Redevelopment Agency, Liliha Square includes a seventeen story apartment building which rises from a two story podium. In addition, a free standing, two story bank building, sited at the front corner of the property, is also a part of the complex. The podium houses commercial units on the first story and parking above. A wide, cantilevered, concrete band adorned with square panels, defines the two stories. The ground level commercial units are recessed, to provide a protected walkway in front of the stores. The aluminum store fronts remain relatively intact although most of the original transoms no longer exist. Pre-stressed concrete columns, measuring either 12” x 18” or 16” x 30” provide structural support as well as a ground level rhythm.

The high rise apartment has a *mauka-makai* (mountain to ocean) orientation, with its end walls featuring three concrete panels per story. The only windows in the end walls illuminate the double stacked, central corridor. The two faces of the building are each four bays wide, with each bay comprised of an inset lanai with a metal railing and a solid wall framed by a set of three, stacked, single pane, awning windows. The solid wall is of grooved, split-faced concrete block, and aluminum framed, single paned, sliding doors access the lanai.

The bank building has a blue tiled, hip roof, with a “cornice” echoing the podium’s banding. A ridge beam follows the same motif. The L-shaped building is five bays wide, with each bay defined by the pre-stressed concrete structural members. The Ewa (eastern) most bay has a solid wall, while the other four bays are dominated by floor-to-ceiling windows on both stories. The building’s recessed entry is at the Diamond Head-*mauka* (northeastern) corner, which fronts on the complex’s ground level, paved parking lot.

Geoffery Fairfax was the author of *The Architecture of Honolulu,* published in 1971. It was one of the first books on architecture in Hawaii recognizing the unique cosmopolitan nature of Honolulu’s architecture.

This complex is a contributing feature to the potential Kauluwela Redevelopment Area Historic District.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

Developed on land acquired from the Honolulu Redevelopment Agency, the Aloha United Fund building was erected thanks to grant moneys from the Atherton estate and other charitable foundations. The community service center is elevated above the intersection of Vineyard Boulevard and Aala Street, and includes a two story and seven story building built on a terrace, with on grade parking under the terrace. Both buildings are characterized by their poured in place concrete walls with recessed single pane windows. The bottom story of both buildings features floor-to-ceiling, anodized aluminum framed windows. These are recessed from the cantilevered upper stories, adding a sense of lightness to the entire complex. A large scale, concrete pergola mediates the space between the two buildings.

The contractors for the State Capitol, Reed and Martin, were also the contractors for this building.

Planning for a building for the Community Chest, the predecessor of the Aloha United Fund, commenced in 1939 when Frank C. Atherton donated money for the project. World War II interrupted the planning, and it was not until 1967 that the organization began to seriously explore the erection of a building to house their offices and other public service organizations.

Leo Wou is most known in Hawaii for designing the Bank of Hawaii Financial Plaza in downtown Honolulu.

This complex is a contributing feature to the potential Kauluwela Redevelopment Area Historic District.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

Developed under the auspices of the Honolulu Redevelopment Agency, this twenty three story high rise was constructed as an elderly housing project. Originally known as the Kauluwela Elderly Housing project, its name was changed to the present Keola Hoonanea within a year of the building's completion.

Sited on Nuuanu stream, this high rise has a curved footprint and closely follows the design Slavsky used for his award winning elderly housing project, Makua Alii, on Kalakaua Boulevard. As with the earlier project this 164 unit project has lanai walkways on the stream facing side of the building, while on the opposite side the building wall is upwardly curving to promote air circulation through vents under the fixed, single pane windows. The building is entered from the Ewa (eastern) side where a single story modern style, concrete portico extends out from the entry with its bronzed, anodized aluminum double doors and adjoining single pane, floor-to-ceiling, fixed windows. Concrete slats placed at a diagonal form the portico's "walls" regulating the air flow into the walkway.

In order to construct the building, the City granted a variance of three feet from the required standard thirty foot set back from Nuuanu stream.

This highrise is a contributing feature to the potential Kauluwela Redevelopment Area Historic District.

Architectural Description

Along with the Liliha Library, the apartments *Makai* (ocean) of the library, and Kauluwela Elementary School, this building was one of the few in the Kauluwela area to not be razed by the Honolulu Redevelopment Agency.

Built as the Honolulu Salvation Army headquarters, this reinforced concrete building is elevated above the street, with parking at ground level. Concrete steps, near the corner of Vineyard Boulevard and Aala Street, lead up to a courtyard upon which several single story structures front, including offices and chapels for Christian and Buddhist worship.

Alfred Yee is a well-known structural engineer in Hawaii and South East Asia.

This complex is a contributing feature to the potential Kauluwela Redevelopment Area Historic District.

Architectural Description

This 23 story cooperative apartment was developed under the auspices of the Honolulu Redevelopment Agency for moderate income housing. The near square tower is four bays wide on the Makai (ocean) side with the center two bays projecting out from the body of the building. All the bays on this side of the building are dominated by lanai, many of which have been enclosed. The Diamond Head (east) and Ewa (west) sides of the building are two bays wide with scored CMU block walls running up the center of each bay. Recessed windows are at the ends of each bay. The building rises from a podium which serves as space for uncovered parking, and has offices and other community function rooms on the first story, as well as entrances to the elevator lobbies.

This complex is a contributing feature to the potential Kauluwela Redevelopment Area Historic District.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

Kauluwela Elementary consists of six buildings that sit on an 8 acre campus. Open lawn and playcourts characterize the southwestern portion of the campus, and buildings are clustered along the northwestern portion. Buildings Q, M and C are one story tall, and buildings D, E and S are two stories tall. With the exception of Building M, all buildings have concrete frames, concrete block walls, and flat roofs. Building M has a wood frame, wood siding, and a combination roof.

Plans for Kauluwela Elementary were originally drawn up in 1925. At that time, the school's southwestern boundary was approximately the same, but the northeastern boundary extended to N. School St. The only building extant from the schools original design is the 1938 Cafeteria Building or Building M. The campus was redeveloped in the late 1950s, and Buildings D, E, S and Q were all constructed between 1964 and 1972.

This complex is a contributing feature to the potential Kauluwela Redevelopment Area Historic District.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This highly sculptural branch library sets forth a modern, yet ornate, appearance. The strong contrast of rough, mauve brick walls and smooth cast stone detailing initiate a dynamic dialogue. This is intensified by the horizontality of the building and the verticality of the cast stone screen. The library's rounded corners create another strong design thread. Elongated curvilinear shapes assert themselves in the bold awnings over the entrances and along the southern wall, the front window frames, wrought-iron gates, ceiling beams and joists, and even in the layout of the restrooms.

The spacious main reading room utilizes much of the building's 13,900 square feet. Sixteen-foot ceilings, high shelving along the three exterior walls with their clerestory windows, low bookcases on the floor, and a skylight over the main desk open up the room. Double doorways on two sides of the room lead to a walled garden, which wraps around the side and rear of the building. Unfortunately, freeway noise dominates this now inaccessible and poorly maintained area. Rooftop parking for twenty-three cars, hidden by a parapet, contributes to the serviceability of this structure.

This complex is a contributing feature to the potential Kauluwela Redevelopment Area Historic District.

Description

The building at 245 N. Kukui Street is asymmetrical, rectangular and two stories tall. The concrete framed building sits on a slab foundation, and walls are made of concrete block. A tiled mansard roof extends over the building's walls and is supported by thin, full height columns on the front and rear facades. The front and rear facades are four bays wide, and the building's entrance is a small arched opening located in the second bay from the left hand side. Windows are located on the first and second floors and are separated into three different groupings on the front and rear facades: four in the first bay from the left, 9 in the third bay, and 4 in the right hand fourth bay. The sides of the building, which face northwest and southeast, have two corner windows located on each floor.

Architectural Description

Replicating the early Shinto shrine of Izumo Taisha in Shimane Prefecture, Japan, this finely detailed shrine was constructed by Takata, a master builder brought from Japan expressly for this project. Takata used wooden pegs instead of nails in all the joinery. When the building was moved to this site from Leleo Lane in 1966, it was modified to conform to modern building codes, following plans by Robert Katsuyoshi. However, it retains many traditional elements, including the dramatic roofline with chigi (crossed roof finials) and katsuogi (ridge ornaments), and its karahafu (double curved gable)-roofed kohai (portico) with lion-head carved beam ends. The traditional elements of a Shinto shrine include a torii (gateway) accessing the spiritual realm, a wash area to the right for purification, and the entrance bell.

Description

The Agmata Building is two stories tall with a rounded corner on the corner of Liliha Street and North Vineyard Boulevard. The building sits on a concrete slab, has a concrete frame, and a flat roof. Five commercial storefronts are located on the ground floor, and apartments with jalousie windows are located on the second floor. Key features of the building include rusticated CMU blocks, mosaic panels located below the second floor windows, and the Agmata Building sign.

Architectural Description

This one and a half story ecclesiastical building has a shallow pitched, front facing gable roof. It is distinguished by its articulated, structural concrete frame and its concrete, butterfly front wall with a stained glass window running down its spine. To either side of the centered butterfly wall are recessed entry lanai, with the doors to the sanctuary located on their interior side walls. The rear walls of the lanai and the church's side walls are of CMU block. A single story, concrete office and classroom wing runs off the church on its *makai* (ocean) side. It has a flat roof and awning windows.

Description

Mayor Wright Homes consists of 2 auxiliary buildings and 35 apartment buildings located within a single block. Open lawns and parking lots separate the two to three story walkup buildings. Buildings sit on slab foundations, have concrete block walls, and flat built up roofs with solar hot water heaters. Apartments on the second and third floors are accessed via a central staircase and walkways on one side of each building. Each apartment has a laundry room partially enclosed with decorative CMU. Several changes have been made to buildings, including moving staircases from the front to the rear of the buildings, infill lanai with Concrete block, and changing windows from steel sash and hopper windows to jalousie and awning windows respectively.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

The Fujii Store is a two story, double walled, commercial building with residential units on the second floor. It still retains its original tongue and groove walls, although in certain places the vertical boards have been reinforced with plywood. There are two store fronts on the ground level with most of the original display windows boarded up. The second story has fourteen jalousie windows facing King Street, and a corrugated metal awning runs across the façade between the two stories. Four, rectangular, wood slat ventilators are in the attic story. A corrugated metal shed roof covers the building. Behind the building are two, two-story duplexes which have tongue and groove walls, composition shingle hipped roofs, and concrete slab foundations. Wood steps run up the front of the duplex immediately behind the Fujii Building to access the wood lanai/walkway which runs across the rear of the commercial building to access the residential units.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This commercial building has a pentagonal floor plan and is characterized by a wide, fluted, concrete cornice, which projects out from the building's scored CMU block walls. It has a precast concrete structural frame which is in-filled by the scored blocks. A roll-up door is to the right side of the façade and serves as an entry to the commercial space. A bank of vertical jalousie transoms runs across the top of the front wall.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This single story commercial building is characterized by a flat roof with an overhanging front eave. It is four bays wide, with each bay containing a store front. Concrete columns demarcate each bay, and each bay has an aluminum framed store front containing a display window and a single paned door. Above the window and door is a band of vertical jalousie transoms. In two places this transom line has been compromised. The kick plate is of brick sized concrete blocks.

Architectural Description

Built for James Kealoha, this eight story apartment building has a rectangular footprint with a *mauka-makai* (mountain to ocean) orientation. Running parallel to Pua Lane, the building is set back from the road by an uncovered, paved parking lot, and is characterized by inset, lanai with metal railings running the length of its façade. A projecting tower, made of scored CMU block, houses the elevator. Two sets of concrete, dog leg steps are set within the body of the building along the lanai. Windows are jalousie, and a pair of aluminum sliding doors access the lanai. The walls are of scored CMU block and a wide concrete band demarcates the first story from the remainder of the building.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This is a three story, walk-up apartments with five units on each floor. It sits on a concrete slab foundation, and has a flat roof with wide concrete eaves overhanging the front and rear facades. It has 8" half CMU block front and rear walls with end walls made of decorative concrete blocks laid in a pattern to form concentric squares. Lanai/walkways run across the façade on the second and third floors with outset, straight run, concrete steps at either end of the façade accessing the lanai/walkway. The steps are parallel to the façade. The lanai/walkway metal railings feature two wide bands, while the step railings have simple, thin metal balusters. Each unit has a front door with a pair of jalousie windows to either side. Also each unit has a private lanai in the rear which is set under the roof's overhang. A paved, uncovered parking lot is in front of the building and separated from the sidewalk and street by a low mock orange hedge.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This rather straight-forward, CMU apartment building is comprised of two parallel structures, one almost three times the length of the other. Two flat roofed breezeways connect the two parallel structures to form an L-shaped building. Rising three stories in height, lanai/walkway with metal railings service all the units, running down the sides of the two buildings which face each other. Five sets of enclosed concrete steps access the upper stories.

Architectural Description

This four story, condominium contains nineteen two-bedroom units and one one-bedroom unit. It sits on a concrete slab foundation and has a flat roof with a wide parapet. The building is constructed of CMU block and features split-faced block below its jalousie windows. It follows an irregular floor plan with receding and advancing bays fronting on Kanoa Street, with four jalousie windows in each bay. Parking is at the rear (*mauka* or mountain side) of the building, where an E-shaped façade allows lanai/walkway with metal railings to access the five units on each floor.

Architectural Description

This four story, L-shaped condominium has scored CMU block walls, and a flat roof with overhanging eaves with a wide fascia. Its 28 units include 25 two-bedroom and 3 studio apartments. The courtyard formed by the two wings of the L is devoted to paved, uncovered parking. The sides facing the parking lot are characterized by lanai/walkway with metal railings. Doors to the apartments, as well as jalousie windows front on the lanai/walkway. Projecting stairwells with scored CMU block walls and a flat roof provide access to the upper stories and are located at end of each wing. The wing's end walls have two floor-to-ceiling jalousie windows, and the *makai* (ocean facing) wall facing Kanoa Street is four bays wide, with each upper story bay having a pair of floor-to-ceiling jalousie windows and a recessed lanai with a balustrade featuring single cell CMU blocks laid in soldier courses to emulate breezy blocks. Aluminum sliding doors access the lanai. On the ground level the first 1.5 Ewa (western) most bays along Kanoa Street are open to accommodate additional parking.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

Six buildings comprise this housing complex, housing 117 two bedroom units. Five buildings run perpendicular to Vineyard Boulevard, while the sixth building extends across the breadth of the property at its rear (*Makai* or ocean) side. The buildings are three stories high and have flat roofs which are overhanging to protect the cantilevered lanai/walkways which run down the front of each building. Made of CMU block, the end walls are built of decorative block which result in a recessed diamond shaped pattern concrete, dogleg steps are located at the ends of the buildings and have a CMU screen wall with decorative openings. The buildings' roofs extend outward to shelter the steps. Each unit has a door with an aluminum framed picture window flanked by jalousie windows to one side and a pair of aluminum framed sliding windows on the other side. Uncovered, paved parking is accommodated in the areas between the buildings.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This single story, single wall bungalow sits on a post and pier foundation. It has a composition shingled hipped roof with overhanging eaves with exposed rafter tails. It has an inset, left of center entry porch which has a front facing, bracketed, curved gable roof. The porch is approached by three concrete steps with lave rock shoulders. Paneled, square columns, at the outer corners of the porch, support the gable roof, and small modillion-like brackets are under the gable. A paneled balustrade encloses the porch. The walls are of tongue and groove and a 6" girt is below the sill line of the windows. To the right of the porch is a pair of 1 x 1 double hung sash windows. The front door remains intact with its fifteen pane door and its ten pane side lights. A laundry shed with a five panel door and latticed openings extends out from the right side of the house and a shallow, front facing, gable roof covers the shed and its adjoining car port. A pipe column supports the outer corner of the car port.

Architectural Description

A well-composed modern church with Gothic overtones, St. Elizabeth's conveys a dynamic verticality through its two-story entrance, shallow pilaster-like buttresses, and side bell tower. Its Christian foundations are made evident through the use of stylized Tudor Gothic elements, yet with equal subtlety the building reflects its congregation's Chinese heritage and Hawaii's tropic balm. Masonry screens with cross patterns derive from Chinese architectural traditions, and the prominent, narrow entrance, although centered on the body of the building, is not aligned with the front gate, in accord with feng shui concepts. The side lanai with Tudor Revival archways was originally open, with sliding doors accessing the nave.

Inside is the finest ecclesiastic Tiffany window in Hawaii. This window of 1904 includes drapery glass used for the robes and shattered glass for the foliage, both innovations of Tiffany. The window was the gift of the William Procter family of Cincinnati, of Procter and Gamble fame, in memory of Charlotte Elizabeth Procter. Ardent supporters of the mission, the Procters funded the construction of the original Shingle Style church on this property. St. Elizabeth's was formed as a mission of St. Andrew's Cathedral (OA44) tending to the spiritual needs of Chinese immigrants in the Kalihi-Palama district. With the demise of the original church in 1952, the window was retained and placed in the new building. The modern windows in the nave and clerestory date from 1977 and are the work of Judson Studios of Los Angeles. The front window was designed by Bernard Atkins in 1991 and fabricated by Raymond Ho.

Architectural Description

The 1.5 story residence located at 709B N. Vineyard Blvd. is sited midblock on a residential cul-de-sac. The building consists of two connected rectangular structures set perpendicular to each other. The structure located closest to the street is one story tall; the structure on the rear of the property has a sunken first floor and second story. Both structures sit on a post and pier foundation, utilize single wall construction, and have gable on hip roofs. Both structures have a girt.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

Sitting at the corner of King and Palama Streets, this three story retail-apartment complex with its third story red crab sign is a local landmark. Constructed of 8" half CMU block it has an asphalt shingle hip-gablet roof with overhanging eaves and exposed rafter tails. It sits on a concrete slab foundation and has paved, uncovered, customer parking in the courtyard formed by its L shaped footprint.

The first floor houses Tamashiro Market, which specializes in seafood products, including fresh fish. An aluminum framed double doorway is situated right-of-center on the *Makai* (ocean) side of the building and serves as the fish market's entry. The corner to the right of the entry has a lava rock veneer, and an up-turned, concrete awning wraps this corner. Dog leg, concrete steps run up the Palama Street elevation accessing the second story lanai walkway and a door into a third story apartment. The second story lanai/walkway wraps around the front, King Street elevation and services three apartment units on this floor. At the Ewa (western) end of the walkway is another set of dog leg steps which project out from the façade to form the base of the building's L shape. These steps also service a lanai/walkway which runs across the front of the third story. The lanai/walkways have metal railings and all windows are jalousie.

The building was built for the Tamashiro Market and it continues to fulfill its original function. It was erected in 1962 as a two story building, with the third story added in 1968.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This two story, single family house is set back from King Street by an unkept front yard. It has a composition shingled hip gablet roof with overhanging eaves with exposed rafter tails. It is a double wall house with vertical tongue and groove walls and 1 x 1 double hung sash windows. A projecting front porch runs across the façade and has a corrugated metal shed roof supported by square Tuscan columns. Five centered, wood steps lead up to the front porch, and the front entry aligns with the steps. The entry has a set of double doors with a transom above. The transom and the screen doors utilize an arts and crafts motif of long thin panes framing the main pane.

A single story, concrete, deco style garage is to the left of the house in the front yard. It features a roll up front door and eight pane steel framed windows on the side. Fluted pilasters define the front corners and a ribbed band runs around the building above the window and front door opening. The frieze on the front elevation above the band is embellished with three raised diamond shaped lozenges.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

Although these cottages have been re-sided with T-111 and have had their original windows replaced with jalousies, they are significant as rather uncommon examples of a relatively intact, pre-World War I urban worker housing complex in Honolulu. The houses retain their steep, composition shingled, hip gablet roofs with overhanging eaves and exposed rafter tails. They sit on post and pier foundations and retain their balanced asymmetric facades with a recessed entry porch on one side and a canted bay window on the other. Wood steps lead up to the porch. Two houses front on Palama Street and the other two are behind them, with a central walkway providing access to the rear dwellings.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This double wall, single family residence has a steep, composition shingled, hip gablet roof with overhanging eaves and exposed rafter tails. It sits on a post and pier foundation with a horizontal slat apron with three narrow slats alternating with one wide slat. It retains its 2 x 2 double hung sash windows and its vertical tongue and groove walls. Its façade has a recessed entry porch to the right and a pair of double hung sash windows to the left. A new elevated ramp runs from the street to the front porch, presumably for ADA purposes.

Architectural Description

Princess Kaiulani Elementary School consists of five buildings that sit on a 5 acre campus. Three classroom buildings and the cafeteria are clustered on the northwestern side of the campus, and the administration building and parking lot are located on the southeastern portion. The Administration and classroom buildings are two stories tall. Second story classrooms and offices are accessed via stairwells on either side of each building and recessed balconies that span the entire width of each building. All buildings have hipped roofs and are linked by covered walkways.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description:
This three story, CMU block, apartment building faces *mauka* (towards the mountains) and runs perpendicular to Robello Lane. It has a flat, built-up roof with overhanging eaves which shelter the front lanai/walkway and the rear lanai. It sits on a concrete slab foundation and features an end wall with decorative block to provide an appearance of vertical bands running up the building.

The lanai walkways run the length of the façade on each story and feature metal railings. Concrete, dogleg steps provide vertical circulation at either end of the façade. There are five units per floor and all windows are jalousie. A paved, uncovered parking lot is in front of the building. The rear lanai are accessed by a hinged door with a jalousie window in its upper panel. CMU partition walls separate each unit's lanai from the other. The rear lanai railings are covered with corrugated metal on the out facing side.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description
Honolulu Community College Administration Building

Wilson, Okamoto, 1973

This two story, flat roofed, reinforced concrete building faces *makai* (towards the ocean) and fronts a parking lot. It has an asymmetric façade with a projecting first story, and is distinguished by canted, cantilevered, concrete parapets, which run part way across the façade above both the first and second stories. The parapets are adorned with raised, rectangular panels. The façade is eighteen bays wide, with the twelve Ewa-most (western-most), first story bays projecting out from the rest of the first story. Each of these bays has a recessed, single pane fixed window. The thirteenth bay from the Ewa end has a large, nine pane, bronzed anodized aluminum window. It is sheltered by the parapet, which wraps around the corner and concludes at this juncture. The remaining five bays are solid concrete wall, with each bay demarcated by a panel scored in the concrete. Raised letters proclaim, “University of Hawai`i Honolulu Community College” with the University seal above the lettering.

On the second story the parapet extends across sixteen bays, each of which has a window similar to those on the first story. The last four bays are again solid wall, with each bay demarcated by a panel scored in the concrete. This concrete wall rises above the height of the parapet in a pylon-like fashion.

Entries on either side of the building enter into lobbies which access the interior of the building. These entries have concrete canopies which follow the motif of the parapets.

Honolulu Community College Cosmetology and Apparel Trades Building

Vernon M. Kim, 1971

This two story, flat roofed building faces *makai* onto a parking lot. It sits on a raised concrete foundation and has an articulated, reinforced concrete structural frame which is in-filled by scored, split-faced CMU block. It is distinguished by projecting lanai/walkways which wrap around the four sides of this rectangular structure. The flat roof has overhanging eaves which protects the upper lanai/walkway from the elements. The eave’s scored concrete fascia is scalloped. A heavy, concrete balustrade with canted square balusters adorns the second story

HAWAII STATE HISTORIC PRESERVATION DIVISION
HISTORIC RESOURCE INVENTORY FORM –Reconnaissance Level

lanai/walkway, while metal railings adorn the first story. A set of centered, concrete steps lead from the ground to the first story lanai on the *makai* (ocean) and *mauka (mountain)* sides. Double doorways at the tops of the steps access a central hallway which accesses offices and classrooms, as well as stairs to the second floor. There are no windows on either story, with only classroom and restroom doorways fronting on the lanai/walkways. Clerestory wood slat jalousies provide the classrooms with light and ventilation.

Architectural Description

This four story, CMU block, apartment building sits perpendicular to Akepo Lane and is distinguished by the breezy block in its end wall. It has a flat, built up roof with overhanging eaves and sits on a concrete slab foundation. It features jalousie windows and flat, concrete hoods run down both sides of the building immediately above the window heads to delineate each story. The building is entered from the end wall through a pair of non-historic metal gates, with the breezy blocks screening the concrete steps, which access each floor's double stacked central hallway. On the ground level, to the right of the entry gates, is a single story office wing which is made of split faced blocks and has a flat roof with overhanging eaves. The original windows in this wing have been replaced with sliding windows.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description:

This two story, CMU block building has a rectangular floor plan. It is two bays wide with split face block pilaster-walls demarcating the ends of the building and the two recessed bays with their split face block walls. The flat roof has a metal parapet with the name, “Aloha Tofu Factory, Inc” written across it in raised letters. To either side of the name is a turtle and a bird, which do not appear to be original. The right side bay is dominated by a roll up door. The left bay has two hinged doors on the first story and a lanai with a concrete railing on the second. At the rear of the lanai are offices with sliding single pane windows.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

Located at the corner of King Street and Akepo Lane, this four story building follows a U-shaped plan with the paved, uncovered parking in the courtyard area fronting on Akepo Lane. It has a flat, built-up roof with overhanging eaves, and sits on a concrete slab foundation. Its walls are of 8" square half CMU blocks and each wing is five bays long with concrete pilasters demarcating each bay. Each bay contains two small bathroom jalousie windows, which are flanked on either side by a pair of jalousie windows. It follows a central hall plan with dogleg steps at the ends of the two wings. The King Street elevation at the Diamond Head includes a commercial space with single pane display windows on the ground level as well as a recessed entry to the building. Initially the building served as a dormitory, with approximately 291 rooms.

Architectural Description

The building located at 954 Akepo Lane is a three story, rectangular building, with four apartments on each floor located midblock on a small lane. The building sits on a concrete slab foundation, has CMU block walls, and is capped by a flat roof with overhanging eaves. The building's twelve apartments face the mountains and sea and are accessed by two staircases on the *mauka* (northeastern) side of the building. Each apartment has a balcony on the *makai* (southwestern) side of the building.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This building appears to have been the result of three building episodes spanning from 1928 to at least 1936, as it is comprised of three adjoining, stuccoed, masonry structures with common walls. All three have front facing gable roofs, with the two end ones having chevron parapets.

The *Makai* (towards the ocean) section has an asymmetric facade with a roll-up door to the right and a recessed hinged door to the left, which is flanked by former window openings which are now in-filled. Its chevron has a wood slat, segmental arched ventilator, and carries in raised letters the name "Sunrise Soda Water Works Co., Ltd" as well as the dates 1909 and 1928.

The *mauka*-most (mountain most) section has a centered, recessed hinged door flanked on either side by display window openings which have been boarded up. The transom above the door is also boarded up. Above the transom, raised letters proclaim, "Sunrise Soda Waterworks Co., Ltd, 1936". A wood slat, pointed arched ventilator is in its chevron.

The middle section has a recessed roll up door on the first story and a pair of metal doors in a corrugated metal frame on the second. It terminates with a gable end with the corrugated gable roof having no overhang.

Description from Buildings of Hawaii (2011), by Don Hibbard, p.87:

> The Honolulu press greeted the opening of the Palama Theater in 1930 with pronouncements ranging from "a major step in the beautification of the populous Palama district" to "unique in design and bizarre in decorations." With its green tile roof with flared eaves and exposed rafters, three-tiered pagoda tower, and assertive entrance, the theater, situated in a predominantly Asian neighborhood, makes a strong architectural statement. Although the reinforced concrete theater has seen better days, its Chinese motifs still evoke its former grandeur. Alas, its once-colorful facade has been painted, the freestanding pagoda-shaped ticket office no longer exists, and the neon sign carried by the smaller rectangular tower has also disappeared, as have the cast-stone dragons which ornamented the corners of the roof.

Architectural Description

The two story commercial building located at 719 N. King St. sits on a busy street corner and is abutted by a theater to the southeast and a parking lot to the southwest. The northern corner of the building is rounded, and a flat awning extends out over the first floor. The building sits on a concrete slab, has concrete block walls, and is capped by a slow slope built up roof. The rounded corner was articulated by offsetting concrete blocks laid in a stack bond.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This single story warehouse is a pre-engineered metal building with a low pitched, lateral running, gable roof. It runs perpendicular to Robello Lane, and the street facing elevation features a roll up door and a hinged door to the left of center with three rectangular, metal slat ventilators above the roll up door. The *Makai* (ocean) facing, front of the building faces a paved parking/loading area. It is four bays long with the two bays closest to the road having one roll up door, while the last two bays each have two roll up doors, each with a set of three rectangular metal slat ventilators above them. A CMU wall runs down the building's rear, *mauka* (mountain) side. The original building contained 4,800 square feet to which a 12,000 square foot addition was appended in 1968.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This extremely utilitarian masonry building has a flat roof and steel framed industrial windows of eight and six panes, on the first and second floors respectively. The windows' bottom two panes are a hopper window. Two doors, each with a corrugated metal shed roofed hood, are found on the Diamond Head (east) side of the building. Extending out on this side of the building is a carport/shop area. It has a steel structural system and a corrugated metal shed roof.

The building appears to retain its integrity; however, the HART survey effort did not deem it worthy for nomination to the National Register.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This single story, modern style bank building is eight bays wide, with each bay demarcated by a coral aggregate pilaster. Three single pane, fixed windows occupy each bay and the windows and their transoms constitute a floor to ceiling wall of glass, interrupted only by a bronzed aluminum band between the two. A projecting entry lanai runs across the three Ewa (western)-most bays and extends an additional bay beyond to partially shelter a sidewalk from the parking lot. The lanai's flat roof aligns with the masonry band between the windows and transoms. Square, coral aggregate columns support the outer periphery of the lanai roof. A set of aluminum, double doors are set in the third bay from the Ewa end of the building and is the main entry. The building is set back from King Street and a sidewalk by a narrow front lawn, while paved parking and automobile entry and exit drives surround the other three sides of the building.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This L-shaped building includes a two story, shed roofed, CMU wing which runs perpendicular to Kaamahu Street, and a recessed, 35'x 60' two story wing which runs parallel to the street. The latter was added in 1970 and is an open shed used for storage with a steel structural system and a metal shed roof. A straight run of metal steps with a pipe railing runs parallel to the *mauka* (mountain) side of the CMU wing, and accesses the building's second story offices' 4' wide lanai/walkway. The offices have jalousie windows.

The building appears to retain its integrity; however, the HART survey effort did not deem it worthy for nomination to the National Register.

X. Continuation Sheet

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Architectural Description

This three story industrial building is four bays wide, with each bay articulated by its pre-cast concrete structural columns and beams. Split face blocks infill the spaces between the structural members, and jalousie windows illuminate and ventilate the second and third floors. The third floor windows are surmounted with single pane transoms, some of which have been supplanted with a double stacked set of awning windows.

Please use this sheet those that follow to attach additional information about the site; including, but not limited to additional floor plans, drawings, photographs, maps, etc.

Landscape Description

Aala Park's triangular shape is formed by the conversion of N. King and N. Beretania Streets at its northern corner and Nuuanu Stream on its southeastern end. The majority of the park is open space with sporadic tree coverage. Curved and lighted concrete sidewalks wind through the park. A basketball court, playground and skate park are located in the eastern corner of the park. A baseball field, restrooms and trellis are located in southern corner.

Doc. No. 1805JA07
Archaeology

Dear Mr. Ouansafi:

SUBJECT: **Chapter 6E-8 and National Historic Preservation Act (NHPA) Section 106 Review – Archaeological Inventory Survey for Mayor Wright Homes Redevelopment Project Honolulu Ahupua'a, Honolulu (Kona) District, Island of O'ahu TMK: (1) 1-7-029:003**

This letter provides the State Historic Preservation Division's (SHPD's) review comments concerning the revised draft report titled *Archaeological Inventory Survey of the Mayor Wright Homes Redevelopment Project Honolulu (Nu'uanu) Ahupua'a, Honolulu (Kona) District, O'ahu Island, Hawai'i TMK (1) 1-7-029:003* (Monahan, May 2018). The submittal was received by our Kapolei office on May 24, 2018.

SHPD was consulted to assist in development of an archaeological inventory survey (AIS), a cultural impact assessment (CIA), and/or an architectural survey for the project on November 16, 2016 (Log No. 2016.02316, Doc. No. 1611JLP15). SHPD consulted with archaeological consultant Christopher Monahan (TCP Hawaii, LLC) regarding development of the AIS and the CIA in June and September 2016, and agreed with the AIS testing strategy on September 8, 2016 (email correspondence; Kimi Matsushima [SHPD] to Chris Monahan [TCP]).

The proposed project is to receive funding from the U.S. Department of Housing and Urban Development (HUD). It is therefore determined to be a federal undertaking, as defined in 36 CFR 800.16(y), and is subject to National Historic Preservation Act (NHPA) Section 106 review. SHPD concurred with the area of potential effect (APE) for the undertaking on June 20, 2017 (Log Nos. 2016.01289, 2017.00472; Doc. No. 1706JLP23). Since the property owner and project proponent is the Hawaii Public Housing Authority (HPHA), the project is also subject to historic-preservation review under Hawaii Revised Statutes (HRS) §6E-8. HPHA is authorized to conduct Section 106 consultation on behalf of HUD and initiated consultation with SHPD on May 25, 2016 (Log No. 2016.01289).

The proposed undertaking will redevelop the approximately 15-acre Mayor Wright Homes complex, which is located in the block bounded by North King Street on the southwest, Pua Lane on the northwest, Vineyard Boulevard on the northeast, and Liliha Street on the southeast. Currently, the Mayor Wright facilities include 35 low-rise buildings with 364 residential units. HPHA proposes construction of new low, medium, and high-rise units with 1000-1500 residential units and mixed-use buildings. The AIS report was prepared at the request of Hunt Companies, Inc., and their planner, PBR Hawaii & Associates, Inc., on behalf of HPHA.

The AIS included on-foot survey of 100% of the project area and subsurface testing involving 24 backhoe-assisted trenches (T-1 through T-24). The survey newly documented four historic properties: a subsurface cultural layer and four features (post-Contact refuse pits) associated with the initial development of the Mayor Wright housing

complex (State Inventory of Historic Places [SIHP] Site 50-80-14-8033), a subsurface layer consisting of pond deposits associated with *lo'i kalo* (taro pondfields) (Site 50-80-14-8034), two buried post-Contact surfaces (Site 50-80-14-8035), and a series of large, post-Contact to modern drainpipes (Site 50-80-14-8036). General stratigraphy includes the modern asphalt surface, the original Mayor Wright development layer (Site 8033), and varying fills and/or agricultural soils and sediments (Site 8034, other agricultural deposits), overlying natural clayey soils probably formed on alluvial sediments deposited by flowing water, in some cases cinders likely from the Pūowaina (Punchbowl) eruption, and the coral shelf.

The report assesses the four sites as retaining integrity of location and materials, and as significant under HAR §13-275-6 Criterion d. Under 36 CFR 800, the sites are determined not eligible for inclusion in the National Register of Historic Places. Pursuant to HAR §13-275-7, the AIS identifies the project effect determination as "Effect, with proposed mitigation commitments" and, per HAR §13-275-8, the mitigation commitment is data recovery in the form of archaeological monitoring.

The SHPD concurs with the site significance assessments and that none of the four historic properties are eligible for inclusion in the NRHP, with the effect HRS 6E effect determination of "effect, with proposed mitigation commitments", and with the proposed mitigation of data recovery in the form of archaeological monitoring.

This revised AIS report satisfies the minimum requirements of HAR §13-276-5. **It is accepted.** Please send one hard copy of the document, clearly marked FINAL, along with a text-searchable PDF version, to the Kapolei SHPD office, attention SHPD Library.

SHPD anticipates reviewing and accepting an archaeological monitoring plan meeting the requirements of HAR §13-279-4 prior to project initiation.

HPHA and HUD are the offices of record for this undertaking. Please maintain a copy of this letter with your environmental review record for this undertaking.

Please contact Dr. Jane Allen at (808) 692-8045 or at Jane.Allen@hawaii.gov if you should have any questions or if we can be of assistance.

Aloha

March 2017

Excavation of Trench #13 in progress adjacent to Building 10 (right background)

ABSTRACT – MANAGEMENT SUMMARY

TCP Hawai‘i has completed the first part of Archaeological Inventory Survey (AIS) work in an approximately 15.3-acre project area in Honolulu in support of the Mayor Wright Homes Redevelopment Project (TMK [1] 1-7-029:003). As described below, there will be some additional AIS testing when the existing buildings in the project area are demolished. The landowner is the Hawai‘i Public Housing Authority. For the purposes of this AIS, the Area of Potential Effect (APE), synonymous with “project area” in this report, is the same as the physical footprint of the TMK parcel. We use the term “direct APE” throughout this report to refer specifically to the APE for archaeological resources (to distinguish it from the broader APE for architectural resources that may include more indirect effects). Twenty-four (24) backhoe-assisted trenches were excavated in the project area, according to an SHPD-approved trenching plan. Four (4) historic properties were identified: State Inventory of Historic Places (SIHP) # 50-80-14-8033, exposed in nearly all of the trenches (21 of 24), is a subsurface layer consisting of four (4) features. It represents a project-area wide grading/bulldozing and pit-filling (dumping) event that occurred just prior to, and in preparation for, the construction of the Mayor Wright Homes residential complex (circa 1952-3). Site 8034, exposed in several trenches in the mauka (inland) portion of the project area (Trench #s 6, 7, 10, 15 & 17), is a subsurface layer consisting of gray clay interpreted as pond sediments, most likely the remnants of traditional Hawaiian lo‘i kalo (irrigated, pond-field, taro cultivation). There is abundant historical evidence that, in pre-Contact times—before the development of Honolulu Harbor and in the early nineteenth century and subsequent urbanization—the project area represented a prime location for traditional Hawaiian subsistence cultivation of taro; and such activities continued in some portions into the early twentieth century. The upper portion of this sedimentary layer—and this site—appear to have been partially truncated by the grading/bulldozing. Site 8035 consists of two features, both are asphalt and/or concrete surfaces (exposed in Trench #11 [Feature 1] and Trench #12 [Feature 2], respectively) dating from the late historic/early modern period. Site 8036 is a set of very large drainage pipes (exposed in Trench #21) also dating from the late historic/early modern period. All four (4) historic properties have been evaluated as significant under criteria d (State) and D (Federal) for their intrinsic informational value to research on the history and prehistory of Honolulu, its urbanization, and the advent of public housing in the State of Hawai‘i. We recommend that sufficient documentation of the four (4) historic properties identified in this AIS report has now been completed, and TCP Hawai‘i recommends no further archaeological or historic preservation work is needed for these sites. During consultation with the SHPD-Archaeology Branch, the issue of archaeological testing (excavation) under the existing buildings—once they are demolished (they are currently occupied by hundreds of residents)—was raised as a possible, additional round of AIS fieldwork (e.g., as a Supplemental AIS report). *In order to ensure there are no as-yet undiscovered areas with potentially significant archaeological resources, or burials, we recommend a second round of AIS testing (excavation) in the footprints of some of the existing residential structures, when they are demolished in the future.* We recommend a total of 12 additional trenches placed under 12 of the existing buildings (once they are vacated). This additional AIS work can be submitted to the SHPD for review and comment as a Supplemental AIS report. We include a graphic depiction (at the end of the report) showing what an additional 12, on top of the current 24, would look like in terms of project area coverage. Because inventory and identification steps are incomplete at this time, we are not ready to recommend an effect determination—in accordance with HAR § 13-275-7—at this time. Likewise, since the inventory and identification steps are incomplete, we are not ready to recommend an effect determination under Section 106 (36 CFR Part 800) either. When we have completed sufficient AIS testing, we will recommend such legally-mandated determinations for SHPD concurrence.

INTRODUCTION

On behalf of the project proponent, Hunt Companies, Inc., and its local planner, PBR Hawaii & Associates, Inc., TCP Hawai'i, LLC, has completed the first part of Archaeological Inventory Survey (AIS) work in an approximately 15.3-acre project area in Honolulu in support of the Mayor Wright Homes Redevelopment Project (TMK [1] 1-7-029:003) (Figure 1, Figure 2 and Figure 3).

As described below, there will be some additional AIS testing when the existing buildings in the project area are demolished. The landowner is the Hawai'i Public Housing Authority (HPHA). For the purposes of this AIS, the Area of Potential Effect (APE), synonymous with "project area" in this report, is the same as the physical footprint of the TMK parcel. We use the term "direct APE" throughout this report to refer specifically to the APE for archaeological resources (to distinguish it from the broader APE for architectural resources that may include more indirect effects).

The project area is bounded by N. King St., Pua Lane, Vineyard Blvd., and Liliha St. in a thoroughly urbanized/developed part of Honolulu just west of the channelized lower Nu'uanu Stream. Iwilei is just makai (seaward) of the project area; Kalihi and Kapālama are to the 'Ewa (west) side; Chinatown and the old center of Honolulu are located to the Diamond Head (east) side.

Proposed Undertaking

Mayor Wright Homes—a public housing complex built by the HPHA—were first occupied in 1952 or 1953 (depending on the source), making them approximately 64 or 65 years old.[1] The proposed undertaking will replace the existing 364 residential units—currently consisting of 35 separate, low-rise buildings (plus an administration building)—with an entirely new 1,000 to 1,500 residential units and other mixed-use structures. The new development will include low, medium and high-rise buildings. This project is considered to be part of the Transit-Oriented Development (TOD) associated with construction of the Honolulu Rail Transit Project.

Historic Preservation Context

There have not been any previous archaeological surveys in the project area because the Mayor Wright Homes were completed prior to the introduction of applicable environmental and historic-preservation laws (starting in the late 1960s). Due to the project's anticipated involvement with the U.S. Department of Housing and Urban Development (HUD), possibly including funding, this project is subject to review under Section 106 (36 CFR Part 800) of the National Historic Preservation Act of 1966, as amended. The project is also reviewable under Hawai'i Revised Statutes (HRS) 6E-8 and Hawai'i Administrative Rules (HAR) § 13-275.

The subject AIS was conducted in accordance with Hawai'i Administrative Rules (HAR) § 13-276. As such, we consulted extensively with the State Historic Preservation Division (SHPD) to develop an appropriate scope of work to ensure all historic properties are identified. One of the results of consultation with SHPD was the requirement that additional AIS testing be conducted in the footprints of some of the existing buildings—which were occupied by tenants at the time of our current survey—once the buildings are demolished (see discussion of this in our Conclusion).

As described further in the document (see Methods section), we also conducted extensive community outreach and consultation with numerous individuals and agencies, including Native Hawaiian organizations. The consultation objectives were (1) to provide notification that this project could affect historic properties of interest to the community; (2) to seek consulted party views on the methods by

[1] The above-ground, architectural structures in the APE/project area are being evaluated by Fung Associates, Inc.

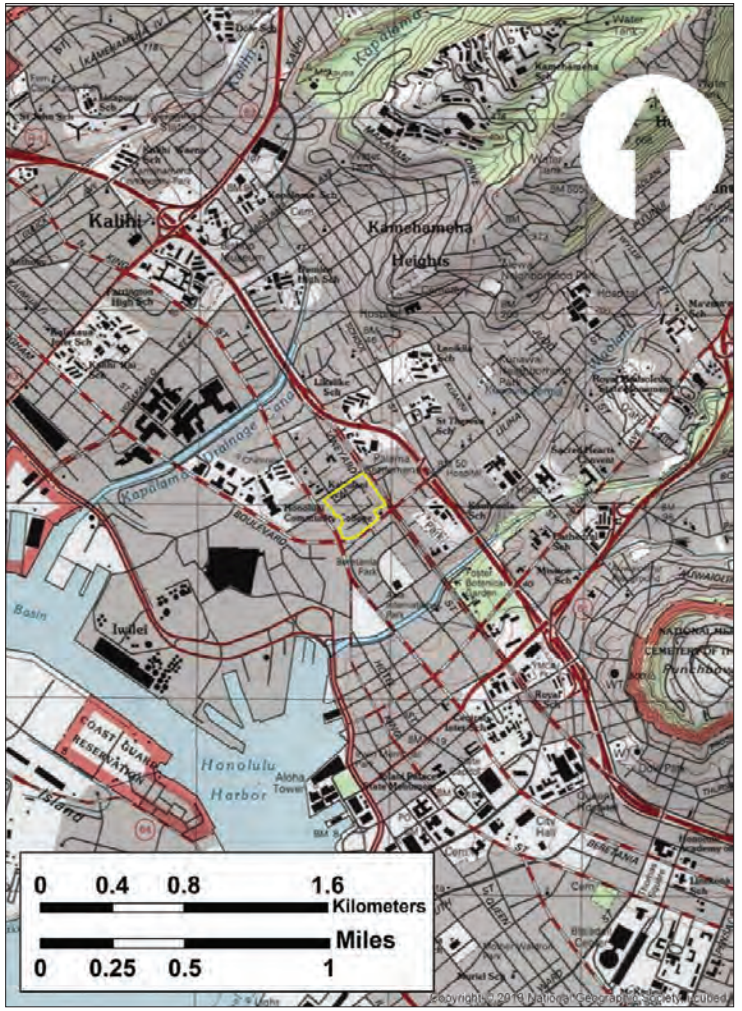

Figure 1. Project area (yellow outline) depicted on a USGS topographic map (base map source: ESRI's ArcMap 10.2.2)

Figure 2. Project area (yellow outline) depicted on an aerial photograph

Figure 3. TMK map of project area and other parcels in same block (source: TMK data State GIS layer)

which we identified and evaluated historic properties in the project area; and (3) to solicit consulted party views on the proposed undertaking's potential effects on historic properties.[2]

Project Area Description

The project area block, bounded by N. King St., Liliha St., Vineyard Boulevard and Pua Lane, is fully urbanized with no naturally-occurring plants or animals, no natural streams, drainages or waterways, and minimal topographic variation other than a gentle slope down to the makai (seaward) direction. Elevation varies from approximately 25 ft. (7.6 m) above mean sea level (amsl) along Vineyard Boulevard to 10 ft. (3.0 m) amsl along N. King Street. About half of the project area is covered by asphalt, concrete and above-ground structures, while the rest consists of open grass (Figure 4). Mean annual rainfall in this part of O'ahu is approximately 30 inches (762 mm) (Giambelluca et al. 2013). The project area is subject to a leeward-type of climate with winter (so-called Kona) rains predominating, and very light trade-wind rains coming down from Nu'uanu Valley.

According to the U.S. Department of Agriculture's classification system, natural soils in the project area consist exclusively of Ewa silty clay loam (EmA), which occur on moderately sloping (0-2°) slopes (Foote et al. 1972). This natural soil is the result of admixture of decomposing basalt bedrock (parent material), downslope (colluvial) deposition, and alluvial deposition from the Nu'uanu Stream, now (in its channelized configuration) about 500 m to the east. Before it was urbanized, the project area would have been periodically subject to flooding and overbank sedimentary deposition from the Nu'uanu/Waolani stream system. As we document in the Results section, in addition to exposing loamy sediments in

[2] A Cultural Impact Assessment (CIA) is also being conducted in accordance with Hawai'i Revised Statutes (HRS) § 343 and HAR § 11-200, as well as the State Office of Environmental Quality Control's (OEQC) 2012 *Guide to the Implementation and Practice of the Hawaii Environmental Policy Act.*

Figure 4. Representative view of project area showing typical grassy areas, sidewalks in background, overhead electrical utilities and residential two- to three-story buildings

excavation, we also discovered a relatively shallow, lithified coral-reef bedrock in several trenches along the southwest side of the project area; we believe this represents the remnants of a once-elevated lithified reef—probably a late Pleistocene formation from the Waimānalo Sea Stand—as depicted on an 1817 historic map by Otto von Kotzebue (Fitzpatrick 1986:48-9) (see Figure 8).

METHODS

This section describes the methods of archival research, consultation, fieldwork and post-fieldwork activities for this project.

Archival Research

Some information in this report is based on recent archaeological and cultural-resource studies of the immediate area, including Belluomini et al. (2016), Kumu Pono (2013), SRI Foundation and Kumu Pono (2013), and Hammatt (2013). We also conducted multiple records searches at SHPD's library in Kapolei; and utilized these on-line databases to obtain cultural, historical and archaeological data:

- OHA's Papakilo database (http://papakilodatabase.com/main/main.php)
- OHA's Kipuka database (http://kipukadatabase.com/kipuka/)
- Bernice P. Bishop Museum archaeological site database (http://has.bishopmuseum.org/index.asp)
- Bishop's Hawaii Ethnological Notes (http://data.bishopmuseum.org/HEN/browse.php?stype=3)
- University of Hawai'i-Mānoa's digital maps (http://magis.manoa.hawaii.edu/maps/index.html)
- DAGS' State Land Survey (http://ags.hawaii.gov/survey/map-search/)
- Waihona 'Aina website (www.waihona.com)
- Digital newspaper archive "Chronicling America, Historic American Newspapers" (http://chroniclingamerica.loc.gov/lccn/sn82014681/)
- US Library of Congress digital maps (https://www.loc.gov/maps/)
- Hawai'i State Archives digital collections (http://archives1.dags.hawaii.gov/)

PBR Hawai'i & Associates staff also brought to our attention, and provided a copy of, a relevant, peer-review article by Kam (2013) that we cite in the historic period background review section of this report. Matt McDermott (Cultural Surveys Hawai'i) provided assistance with links to reports by Kepā Maly (Kumu Pono 2013; SRI Foundation and Kumu Pono 2013). Kimi Matsushida (Lead Archaeologist, O'ahu Island, SHDP) provided a link to Belluomini et al. (2016).

Consultation

From the end of May to early June, 2016, we sent formal consultation letters (Appendix A) regarding our proposed Archaeological Inventory Survey (AIS) to the following agencies and individuals:

1. SHPD/DLNR (Administrator Downer, Archaeology Branch Chief Susan Lebo, O'ahu Burial Site Program staff Regina Hilo, and Ka'āhiki Solis);
2. OHA (Ka Pouhana/CEO Crabbe and staff in Compliance, Kai Markell and Lauren Morawski);
3. Kalihi-Palama Neighborhood Board (Chair Ryan Mandado);
4. Kalihi-Palama Hawaiian Civic Club (Pelekikena/President Leimomi Khan);
5. Cynthia Yoshida (Public Housing Supervisor, MWH);
6. Historic Hawaii Foundation (Kirsten Faulkner);
7. Ka'anohi Paulette Kaleikini (Native Hawaiian, cultural descendant, Honolulu area);
8. Michael Lee (Native Hawaiian, cultural descendant, Honolulu area).

We provided the O'ahu Island Burial Council in June, 2016, with an informational presentation about our proposed AIS. Emily Davids from Hunt Companies, Inc., attended with Chris Monahan.

Ka'anohi Kaleikini and I exchanged emails in May-June, 2016, regarding her consultation input. Her primary input was to bring our attention to the nearby, recent AIS by Cultural Surveys Hawai'i (i.e., Belluomini et al. 2016); and to raise the issue of including cultural monitoring in our project.

OHA replied in writing on June 28, 2016, to our formal consultation letter to them (see Appendix A). OHA had nothing specific to communicate to us. Chris Monahan also communicated briefly by phone in June, 2016, with OHA Compliance staff, Kai Markell and Lauren Morawski.

Chris Monahan met formally with Susan Lebo, in June, 2016, about our proposed AIS. She suggested we reach out to SHPD staff, Kaʻāhiki Solis, History and Culture Branch, regarding information about the MWH property. We emailed Kaʻāhiki Solis on June 3, 2016, and again in September, 2016. She then provided some substantive input about the Cultural Impact Assessment (CIA) we are preparing.

Prior to the start of fieldwork, we conducted additional consultation with the SHPD regarding a trenching plan (fieldwork scope of work) for the AIS (see Appendix A). Chris Monahan met formally in August, 2016, with Susan Lebo and Kimi Matsushida. A final (revised) trenching plan dated September 8, 2016, was formally approved by Kimi Matsushida by email shortly thereafter.

Fieldwork

On September 19, 2016, Chris Monahan worked on site with the toning consultant to ensure trench locations would avoid underground utilities. Based on the toning results, we made minor adjustments to the majority of trench locations, due to the very high number of known and unknown subsurface obstacles (principally, gas and water lines). These adjustments included shortening many trenches from our desired maximum length of 6.0 m (20 ft.); and, altering the orientation of some trenches.

Figure 5 and Figure 6 show examples of the logistical difficulty of conducting backhoe excavation in the project area, given that it includes three dozen buildings housing hundreds of people. Figure 7 and Figure 8 depict the location of test excavations (trenches) in the project area. Trench locations were recorded using mapping-grade (Trimble) GPS that consistently achieved geospatial accuracy to 0.1–0.2 m.

All fieldwork was conducted by Chris Monahan, Ph.D., the Principal Investigator, and Archaeologist Michael (Pablo) Rivera, B.A., from September 20–27, 2016, a total of 96 person-hours. Backhoe excavation proceeded slowly with the operator removing approximately 5 cm at a time. One archaeologist worked directly with the operator to monitor sediments as they were removed from the trench. The archaeologist stopped or slowed down the operator to observe any anomalies or subsurface deposits or potential features of interest. Small samples of sediment were occasionally passed through a standard, ¼-inch metal-mesh screen in order to inspect natural and/or potential cultural material. We photographed representative cultural materials—which consisted exclusively of late historic/early modern debris (mostly glass, ceramics, metal, brick, paving stones)—for inclusion in the Fieldwork Results section; and saved (for inclusion in the Laboratory Results section) chronologically diagnostic materials such as glass bottles with maker's marks.[3] All trenches were photographed with a visible, professional photo scale and north arrow during and after excavation, which terminated at bedrock or (in two cases) the water table. In addition to overview photographs, we also photographed the profile walls. We described the soil-sedimentary layers according to standard archaeological methods used in Hawaiʻi (e.g., dimensions, cultural materials, if present, Munsell color, grain size, consistency, structure, inclusions, if present, and so on); and prepared scale drawings of one entire (long axis) profile wall. We include all of this information, as well as interpretations on the origins and age, if possible, of each layer (e.g., natural versus cultural, including fill) in the Fieldwork Results section below.

GIS Specialist Todd Tulchin, B.S., recorded all trench locations using the Trimble GPS with Chris Monahan on October 6, 2016 (see Figure 7 and Figure 8).

Post-fieldwork Activities

Following the conclusion of all fieldwork activities, we emailed an End of Fieldwork summary to SHPD (see Appendix A). GIS maps of trench locations were prepared by Todd Tulchin using ESRI software. Adobe Illustrator was used to prepare the stratigraphic profiles. ESRI's ArcMap 10.2.2 was used to georeferenced the many historic maps presented in this report.

[3] These materials, which are the property of the landowner, are currently stored at TCP Hawaiʻi, LLC.

Figure 7. Location of test excavations (backhoe trenches) in project area; note, locations were recorded with mapping-grade GPS that consistently achieved geospatial accuracy to within 0.1-0.2 m

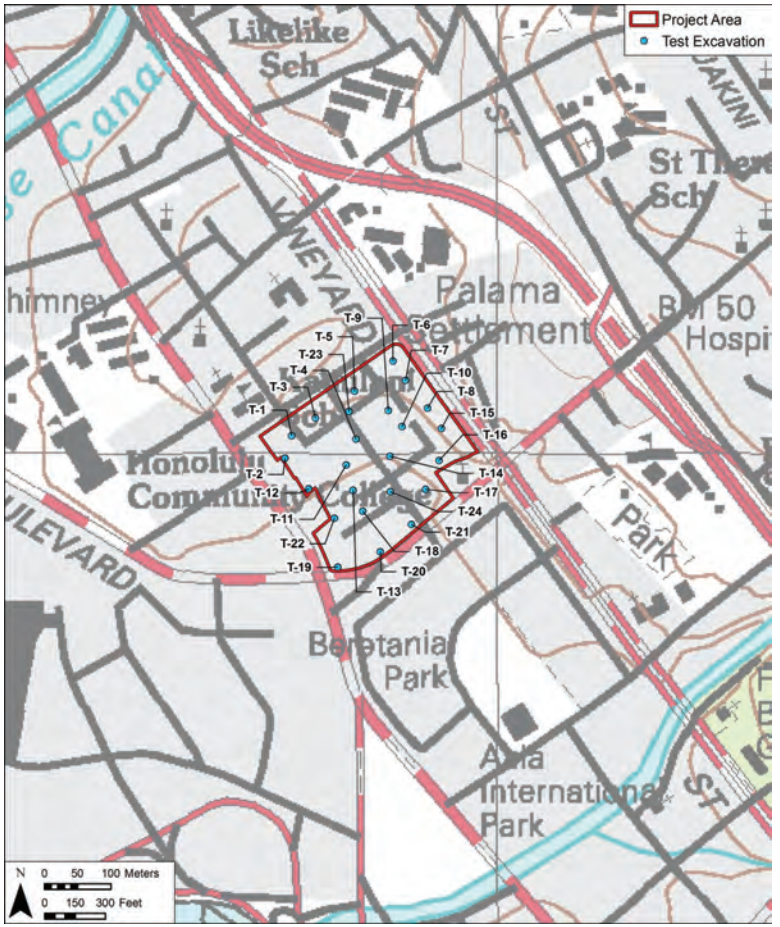

Figure 8. Location of test excavations (backhoe trenches) in project area; note, locations were recorded with mapping-grade GPS that consistently achieved geospatial accuracy to within 0.1-0.2 m

CULTURAL AND HISTORICAL CONTEXT

This section includes a synthesis of relevant cultural and historical information related to the types of land uses in the project area from pre-Contact, traditional Hawaiian times into the historic period, right up to construction of the Mayor Wright Homes around 1952.

Hawaiian Cultural Landscape

Ahupuaʻa boundaries can be extremely variable; and, depending on which source one cites, or what time period is referenced, the answer to which ahupuaʻa the Mayor Wright Homes is in varies. Honolulu Ahupuaʻa is an atypical example that has more to do with the political history of the nineteenth century—starting with the development of Honolulu harbor as a shipping port for Euro-American merchants in the first few decades of the 1800s—than with traditional Hawaiian settlement or subsistence patterns (Beechert 1991; Daws 2006). For example, the Hawaiʻi state GIS layer considers Nuʻuanu Valley and Stream (including the project area) as part of the large ahupuaʻa of Honolulu. Under this configuration, there is no Nuʻuanu Ahupuaʻa, which almost certainly does not reflect how pre-Contact Hawaiians viewed this landscape. On the other hand, recent USGS topographic maps show Nuʻuanu Ahupuaʻa coming down from the mountains but stopping at School Street. The well-known Bishop Museum compendium of archaeological sites and wahi pana (legendary places) *Sites of Oahu* (Sterling and Summers 1978) shows a similar configuration to the USGS version. Finally, Snakenberg's (1990) well-known "pre-Mahele" configuration of ahupuaʻa does not include Nuʻuanu (which is subsumed under Honolulu).

As described below, referring to the many middle nineteenth-century Land Commission Awards in the Mayor Wright Homes project area, Hawaiians consistently referred to their land as being in the ʻāina of Honolulu (also known traditionally as Kou). We believe the original inhabitants of Oʻahu—prior to the invasions by Kahekili (Maui) starting in the late eighteenth century, and later by Kamehameha (Hawaiʻi)—would have referred to the project area environs as Nuʻuanu Ahupuaʻa, given its location in the flood plain of this stream.

Figure 9 is a portion of an 1817 map of Honolulu Harbor and environs by Otto von Kotzebue (Fitzpatrick 1986:48-9) with the georeferenced project area. Beyond its general depiction of the early historic-period cultural landscape of Honolulu (e.g., showing a shoreline fishpond near the mouth of the Nuʻuanu Stream), this map is directly relevant to our study for several reasons. First, it shows the project area was in a dense cluster of loʻi kalo (irrigated taro)—these are the numerous rectangles arrayed in a grid pattern. Second, it shows several house sites (smaller, triangular symbols) scattered around the west side and east side of the loʻi kalo; and on top of what appears to be an elevated puʻu of some kind in the southern portion of the current project area. Third, and very specific to our excavation results, *the trenches we dug in this apparently elevated (southwestern) portion of the landscape contain shallow lithified coral-reef bedrock. We believe the elevated puʻu landform in Kotzebue's map is a bit of raised coral shelf that was eventually leveled or graded down.* It is likely this landscape feature is a late Pleistocene formation representing the well-documented Waimānalo Sea Stand dating to approximately 120,000 years before present, an interglacial period when sea levels in Hawaiʻi were some 7.5 m (24.8 ft.) above current levels (Macdonald et al. 1983; Ziegler 2002).

Figure 10 is a small portion of an 1825 map of Oahuʻs south shore by Charles Malden (Fitzpatrick 1986:62-3). This map does not include any details of the landscape in the project area environs, so we have not bothered to specifically call out the exact boundaries of the project area. It does show the addition of a wall—presumably a seawall—just makai of the project area, indicating perhaps the earliest map evidence of the start of landfilling activities in what would become Iwilei. Discussions by Daws (2006) and Fitzpatrick (1986) suggest this structural feature may have been part of an early effort to prevent the Honolulu harbor from silting up and becoming too shallow for shipping due to the muddy delta at the mouth of Nuʻuanu Stream.

Figure 9. Portion of 1817 map of Honolulu Harbor and environs by Otto von Kotzebue (Fitzpatrick 1986:48-9) with approximate location of project area in red outline in the heart of the Nuʻuanu flood plain

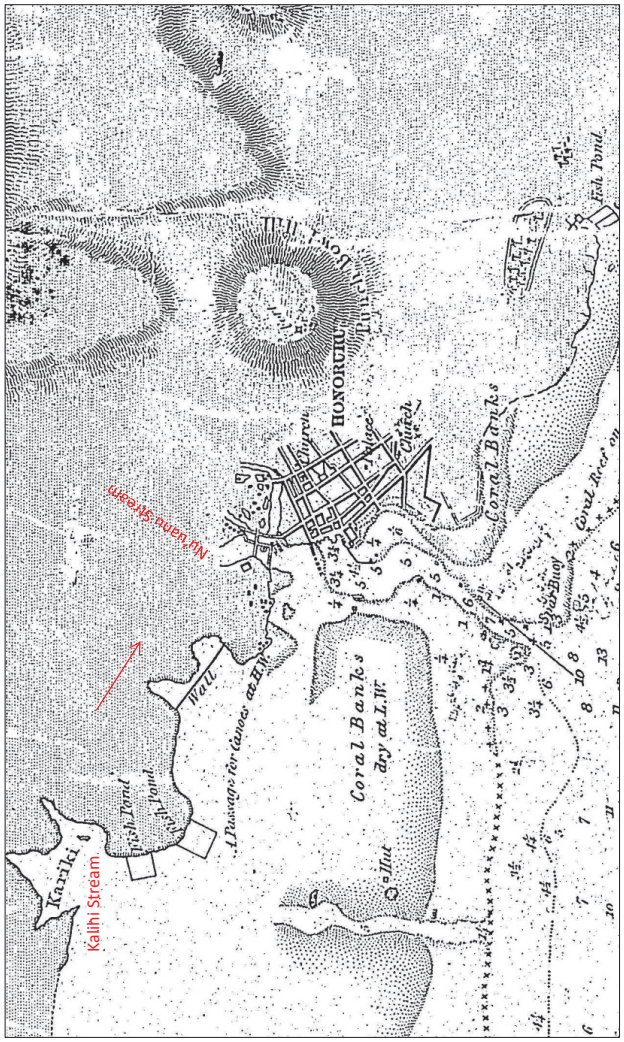

Figure 10. Portion of 1825 map of Oahu's south shore by Charles Malden (Fitzpatrick 1986:62-3) with approximate location of project area indicated by arrow

Mid Nineteenth-Century Developments in and near the Project Area

Figure 11, a portion of 1855 map showing Honolulu harbor and environs by J.M.H. de La Passe (Fitzpatrick 1986:82-3), shows the georeferenced project area in a dense cluster of lo'i kalo (taro ponds) with scattered house sites here and there. Several fishponds—including Kuwila and Kawa—are located along the shoreline. By this time (1855), Honolulu had changed greatly from its traditional (pre-Contact) condition and character, when it was not yet a major chiefly settlement (Waikīkī enjoyed that status before the turn of the nineteenth century), and even from its early days as a growing harbor town, when Kamehameha the Great was still alive.

By mid-century, the main town of Honolulu was still on the other side of Nu'uanu town (in what would become known as Chinatown). La Passe's map does show an old alignment of King Street passing just south of the project area. This map does not show Liliha Street, which borders the project area on its southeast side, but Daws (2006:268–9), citing several contemporary accounts from newspapers in the 1850s and 1860s, has this to say about the original Liliha Street:

> For years after its formal designation, Liliha Street, to the west of Nu'uanu stream, was interrupted in several places by the raised banks and swampy depressions of kalo patches. This was only one picturesque street nuisance among many in the environs of Honolulu.

Table 1 is a summary of Land Commission Awards in and immediately adjacent to the project area. These data reveal many relevant observations. First, in such a relatively small area—basically the size of a modern city block—there are at least five named 'ili: Kapahaha, Kahawali (sometimes Kahawale), Koiuiu (at least once called "Koiuiu, Leleo"), Hauhaukoi, and Keoneula. Immediately adjacent 'ili include Aala, Kapalama and Kaoaowai. Second, among the names of Hawaiians who were awarded parcels in the project area, there is one Julia (or Juliana) Alapa'i Kauwa (or Kauwa'a), an ali'i nui (high chiefess), sometimes referred to as Princess, who was married to the famous John Young. She died in 1849, and was awarded many other lands, including others on O'ahu (including 'Ewa) as well as Maui and Moloka'i. She is described as the konohiki (overseer or land manager) by some claimants. The table also shows that, when available, land use always includes lo'i kalo, with several house sites, and occasional mention of 'auwai. One person (Kahina) claims a "lo'i iloko," which is a term for a pond-field kalo patch also used as a small fishpond.

Figure 12 is a graphic depiction of kuleana parcels (Land Commission Awards), Land Grants—where people purchased the land from the government (and for which there is generally less publicly available information on land use), and Land Court Applications, which generally represent some kind of quiet title actions taken after the Mahele to obtain kuleana parcels. The three Land Grants, 2063, 2065 and 2346, to Panio, Napehe and Kaona, respectively, were purchased in 1856–7.

Figure 13 and Figure 14 are representative survey maps of two kuleana parcels in the project area (LCAw 1405 to Pihiliilii and 8613 to Keonekapu) from 1854–5. While both of these maps are fairly rudimentary survey depictions—typical of the Mahele documentation, they each show 'auwai entering the properties from the upslope (mauka) side.

Newspaper accounts from shortly after this period indicate a lot of interest in buying and selling these parcels. For example, in an 1873 edition of *The Pacific Commercial Advertiser*, there is an advertisement to sell "4 Kalo Patches" at "Kapahaha, Liliha St." From the same newspaper, in 1881, one Mrs. Kaaea Akepo wishes to sell "…that valuable piece of land, with buildings thereon, situated at Kapahaha, Kapalama-Kai, known as 'THE OLD KING STREET LAUNDRY HOUSE.'"

Figure 15, a portion of an 1878 map showing an early depiction of Liliha Street (southeast side of project area) and King Street, also shows the OR&L railroad line south of the project area just mauka (inland) of the prison, and a couple house sites in the project area.

Figure 11. Portion of 1855 map showing Honolulu Harbor and environs by J.M.H. de La Passe (Fitzpatrick 1986:82-3) with approximate location of project area in dense cluster of lo'i kalo (taro ponds)

Table 1. Summary of Land Commission Awards in and near the Mayor Wright Homes Project Area

LCAw ('āpana)	Acres	Land Use	RP	Name	'Ili	Location Relative to Project Area (PA)	Comments
2072:2	0.30 ac.	2 lo'i kalo & 1 garden house	5572	Kapaalua	Kapahaha	Adjacent to PA (outside PA) between it & King St.	RP 5572 dates to 1864 and includes 3 'āpana in all under LCAw 2072 (2.15 acres in total)
2072:3	0.25 ac.	1 lo'i				*Partially in PA along King St. side (mostly out of PA to King St. side)*	
8525-B:1	1.74 ac.	?	8185	J.A. (Julia Alapa'i) Kauwa (w)	Kapahaha	*Partially in PA at W corner (partially out of PA)*	This appears to be Ali'i (High Chiefess) Julia (or Juliana) Alapa'i Kauwa, or Kauwa'a (born c. 1814, died 1849), described as the Konohiki by some; RP 8185 dates to 1906, and instead of using the term 'āpana, says "part"; she received (and relinquished) many land awards; she received awards in Kona (O'ahu) and 'Ewa, as well as Maui and Moloka'i.
1285:4	1.24 ac.	2 lo'i	1982	Kaluau or Kaluau , W. (w)	Kahawali	*Partially in PA at W corner (partially out of PA)*	Indices of Awards (1929) indicate she received 4 'āpana under LCAw 1285 w. 'ili listed as Kaoawai (Kaoaowai), Kapahaha & Kahawali (Kahawali o Kaeo); Waihona 'Aina listed the 'ili as "Kapahaha & Kahawali"; claims (NR) she received a house lot from Kapaalua at the time of Kinau; calls J.P. Alapa'i the Konohiki
1405:1 (por.)	1.90 ac. (total)	8 lo'i & 1 house site (total)	5553 (por.)	Pihiliili	Kahawali	**Completely in PA**	This LCAw also associated with RP 2397 ('ili also spelled Kahawale in some documents); 'āpana 1 seems to have been partially taken (or sold?) during LCAp 1192
1405:1 (por.)						**Completely in PA**	
1405:4						**Completely in PA**	
933:1	1.05 ac. (total)	3 lo'i & 1 house site	1226	Kamae	Koiuiu	Adjacent to PA (out of PA) south of Desha Lane	Incorrectly spelled Kiouiu in Indices of Awards (1929); he was awarded 4 'āpana in all under this LCAw
933:2						**Completely in PA**	
933:3						*Partially in PA at NE corner (partially out of PA)*	
1078*	0.62 ac.	3 lo'i kalo & 1 "small hut"	4393	Naili or Naihe*	Kahawali	**Completely in PA**	* Naili (or Naihe) for Kanui (cf. Indices of Awards 1929); this 'āpana identified as "loi" on Pihiliili's survey map; Indices of Awards (1929) state: "Awarded by Privy Council by Resolution dated June 23, 1856"; received in Boki's time (i.e., probably 1820s); referred to as an 'ili 'āina
605:2	1.29	3 lo'i	4423	Kalunaaina for Lupe	Keoneula	**Completely in PA (along Pua Lane side)**	Kalunaaina received these lands from Kamehameha III in the time of Ka'ahumanu; he died in 1846 and gave lands to his only child (daughter named Lupe); this award had 6 'āpana; description of 'āpana 2 includes 'auwai
605:3	0.66	2 lo'i				**Completely in PA (along Pua Lane side)**	
6236	6 contiguous 'āpana; total 3.56 ac.	Multiple lo'i	See Comments	Kaaiawaawa	Koiuiu	**Completely in PA (in S corner)**	Unclear if all 6 'āpana are in the project area; there are 6 different Royal Patents: 7339, 8160, 8296, 8338, 8339 & 8342
36 F.L.	0.85 ac.	Lo'i	2248	Nakilaku (or Nakileku)	Aala	Adjacent to PA (outside of PA) near corner of Liliha & Vineyard	--
3 F.L.	0.57 ac.	4 lo'i	2684	Kapo	Hauhaukoi	Adjacent to PA (outside of PA) along Vineyard	In addition to 4 lo'i, "loi maloo" (dried up or not-in-use) lo'i are also mentioned in NT; received in 1839 from (or at the time of) Kinau
2 F.L.	0.67 ac.	5 lo'i & 1 house site	2102	Kamoku	Hauhaukoi	*Partially in PA along Vineyard (partially out of PA)*	Received land from (or at time of) Kinau circa 1839; house site called a "kahuhale"
8520:1	?	?	8197 (por.)	Kaeo, Iosua	Kahawali, Kapalama	**Completely in PA**	Claimant received several 'āpana in different places—even different islands—under same LCAw 8520; e.g., 'āpana 4 is on Lāna'i; 'āpana 2 & 3 are on Maui; 'āpana 5 is Hilo, and so on
8520:1	?	?	8197 (por.)			*Partially in PA along Vineyard (partially out of PA)*	
8520:1	?	?	8293			Adjacent to PA (outside of PA) at N corner	
2107:1	0.37 ac.	2 lo'i iloko (taro/fishpond)	4528	Kahina	Kahawali	**Completely in PA**	Claimant received 3 other, nearby 'āpana under a different Royal Patent (7254)
2107:2	0.42 ac.	Lo'i				*Partially in PA along Vineyard (partially out of PA)*	
640	0.63 ac.	4 lo'i & 1 house	8239	Kamahalo	Hauhaukoi	Adjacent to PA (outside of PA) along Pua Lane	Called "Land Patent" rather than Royal Patent; received in time of Kinau
8613:2	1.40 ac.	6 lo'i	7446	Keonekapu, J.	Hauhaukoi	**Completely in PA**	'Auwai entering from mauka land
25 F.L.	0.37 ac.	3 lo'i	4518	Kukui (w)	Hauhaukoi	**Completely in PA**	Just NE of Kukui St. extension; Kukui was a woman (wahine); received in 1843
4747:2	0.98 ac.	7 lo'i	5610	Kama (w)	Leleo, Koiuiu	**Completely in PA**	'Āpana 1 located in Kapalama; Kama was a woman (wahine); received land from (or at time of) Kinau circa 1839
1362	0.46 ac.	2 lo'i	2681 (por.)	Naholowaa**	Keoneula	**Completely in PA**	** Naholowaa for Hoa (wahine), according to Indices of Awards 1929); FT says this Naholowaa had no claim to the land, he was only a "working man" under Hoa. "She told me to send in a claim for it as she was afraid she should not get her claim in before the Commission."

Abbreviations: LCAw = Land Commission Award; LCAp = Land Court Application; por. = portion; PA = Project area; RP = Royal Patent; NR = Native Register; NT = Native Testimony; FT = Foreign Testimony; w = wahine (woman).
Bold text = LCAw entirely within Project area; *italics = LCAw partially in/partially out of Project area;* plain text = immediately adjacent/abutting Project area

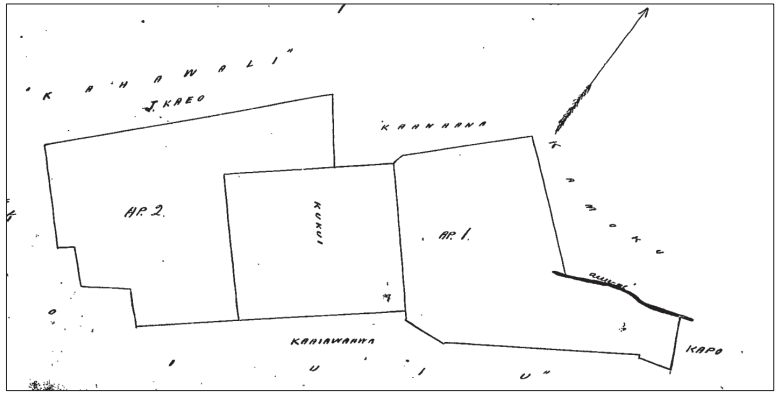

Figure 14. Survey map (circa 1853) from LCAw 8613 (to Keonekapu) showing ‘auwai entering from right of ‘āpana 1 (source: Papakilo database)

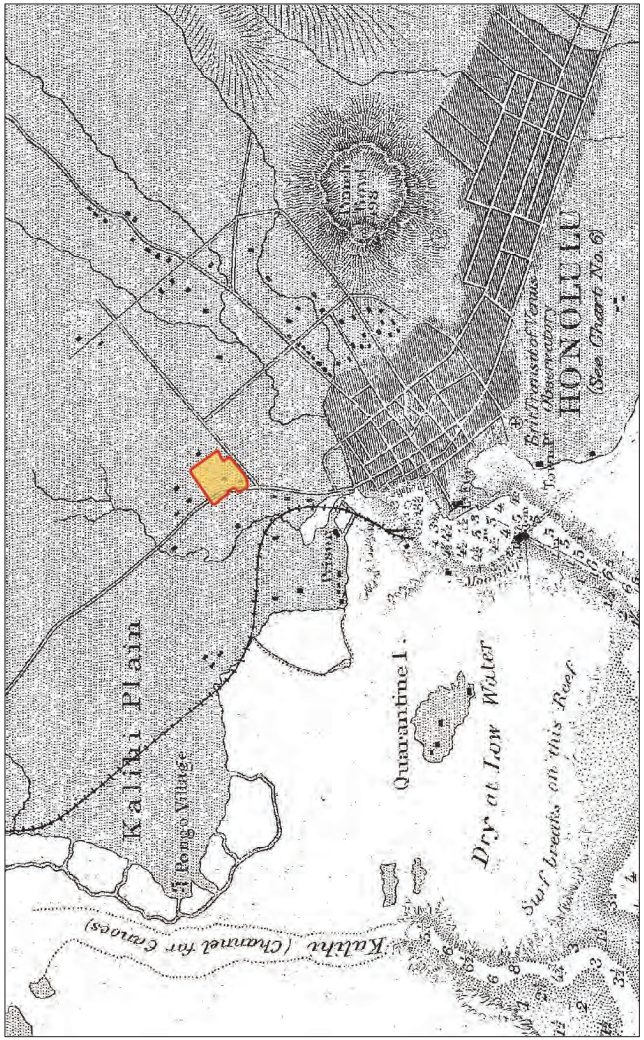

Figure 15. Portion of 1878 map (Registered Map 1505) showing Liliha Street (southeast side of project area) and an early alignment of King Street; note OR&L railroad line (source: DAGS Land Survey website)

Figure 16 is a portion of a draft map created between 1876–1881 by Lyons and Covington (working separately, not together) showing the project area and environs. As discussed by Moffat and Fitzpatrick (2004:40), there are some geospatial inaccuracies on this map, which makes georeferencing of the project area impossible. We have included this map because it shows some important cultural information and place names (e.g., an early depiction of Iwilei), as well as the Insane Asylum mauka of the project area.

Figure 17 is a portion of an 1887 map by Wall showing Liliha and King streets. Note, the labelling of the large structure within the project area ("R. Keliikolani") is incorrect, and should read Queen Lili'uokalani. An important wahi pana, Kunawai Spring, is depicted mauka of project area, just west of Liliha Street.

Figure 18 is a portion of an 1893 map by Wall showing many more cultural details than the previous (1887) version. The Queen's residential compound has been correctly labelled (Lili'uokalani) in this version; note, also, the extensive cross-hatching mauka of the project area and around Nu'uanu Stream that appears to depict lo'i kalo and/or other type/s of cultivated fields.

Figure 19, a portion of an 1897 map by Monsarrat, shows many Hawaiian place names, a new (not seen on other historic maps) pond mauka of School Street ("Waikahalulu"), and the advent of rice cultivation west and northwest of the project area.

Early Twentieth-Century Developments in and near the Project Area

Figure 20, a portion of 1901 map by Monsarrat, shows early neighborhoods and blocks with Hawaiian place names and formalization of many streets. Note that Queen Lili'uokalani's place is no longer depicted in the project area on this map.

A series of 1906 fire insurance maps prepared by Dakin, stitched together into Figure 21, shows the first detailed view of what specific types of structures were built in the project area. By this time, it contained many residential ("tenements"), commercial and light industrial structures, including a large soy factory (Hawaiian Soy Co., Ltd.) along Pua Lane, a small church (Palama Christian Church), laundries, a Japanese hotel, and small "factories" (to make candy and mattresses) along Liliha, as well as horse stables.

A sampling of 1906 real estate transactions listed in *The Pacific Commercial Advertiser*, however, continues to highlight the importance of agriculture in the project area: "10 taro patches" at Kapahaha sold for $2,250, and another (same description) for $3,250. A 1907 listing in the *Hawaii Star* listed sale of a piece of land within the project area (LCA 1405:4, RP 5553 originally to Pihiliilii) for $400 from Caroline K. Silva and husband to Emmeluth Trust.

Figure 22, a portion of 1909 survey map from Land Court Application 170, shows several surrounding kuleana parcels (Land Commission Awards), and still depicts an 'auwai system entering from the mauka (upslope) side.

Figure 23, a portion of 1912 map by Monsarrat, shows neighborhoods and blocks with Hawaiian place names and the formalization of streets and lanes within the project area, including the Kukui Street extension (which was never built, but turned into the central driveway of the Mayor Wright Homes.

Figure 24, a series of 1914 Sandborn fire insurance maps (stitched together), shows a reduction in the overall extent of cultivated garden areas. The previous (1906) location of the Palama Christian Church is now labelled "Auto Painting," and a new structure labelled "Moving Pictures" is located just west of this building.

Figure 25, a portion of 1920 map by Monsarrat, shows neighborhoods and blocks with Hawaiian place names, and new ones just southeast of project area; note also an early (perhaps the first) depiction of the location of Palama Settlement south of King Street.

Figure 16. Portion of draft 1876-1881 map (Lyons/Covington) showing project area environs; there are some geospatial inaccuracies on this map, which makes georeferencing of project area impossible (see arrow for approximate location); this map shows some important cultural information and place names, which is why it is reproduced here (see Moffat and Fitzpatrick 2004:40) (source: U.S. Library of Congress website)

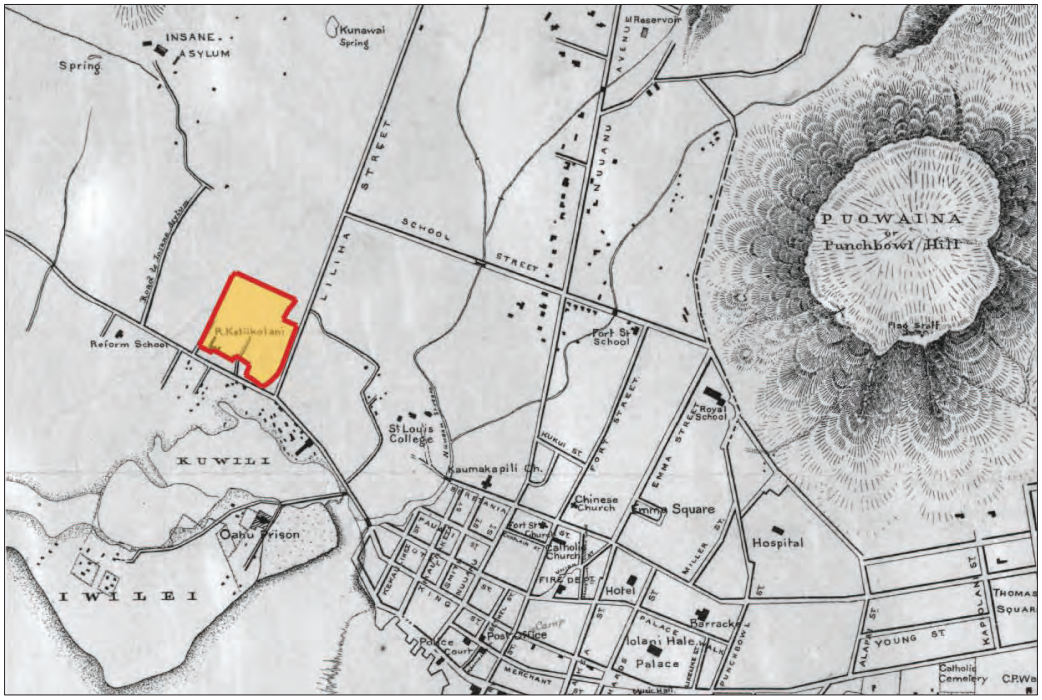

Figure 17. Portion of 1887 (Wall) map showing Liliha St. and King St.; labelling of structure within project area ("R. Keliikolani") is incorrect, and should read Queen Lili'uokalani; note location of Kunawai Spring mauka of project area (source: U.S. Library of Congress website)

Figure 18. Portion of 1893 (Wall) map (Registered Map 1690) showing many more cultural details than the 1887 version (previous image); note that the Queen's house (Lili'uokalani) has been correctly labelled in this version; note, too, the cross-hatching mauka of the project area and around Nu'uanu Stream that depicts lo'i kalo and/or other type/s of cultivated fields (source: DAGS Land Survey website)

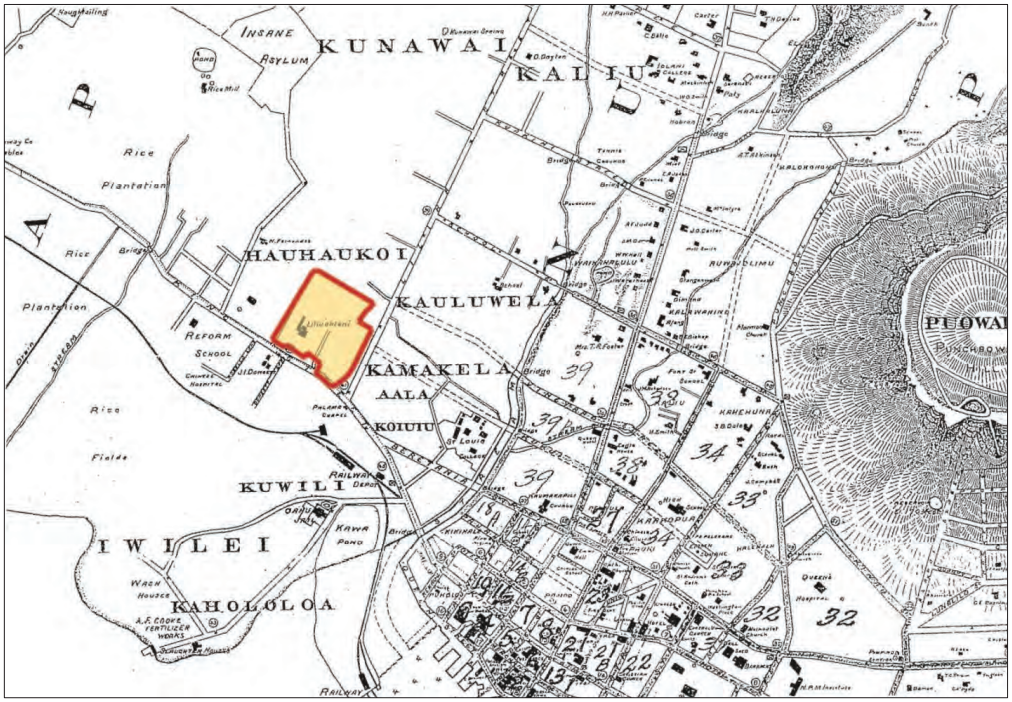

Figure 19. Portion of 1897 (Monsarrat) map (Registered Map 1910) showing many Hawaiian place names, a new (not seen on other historic maps) pond mauka of School St. ("Waikahalulu"), and the advent of rice cultivation west and northwest of the project area (source: UH-Mānoa MAGIS digital collections)

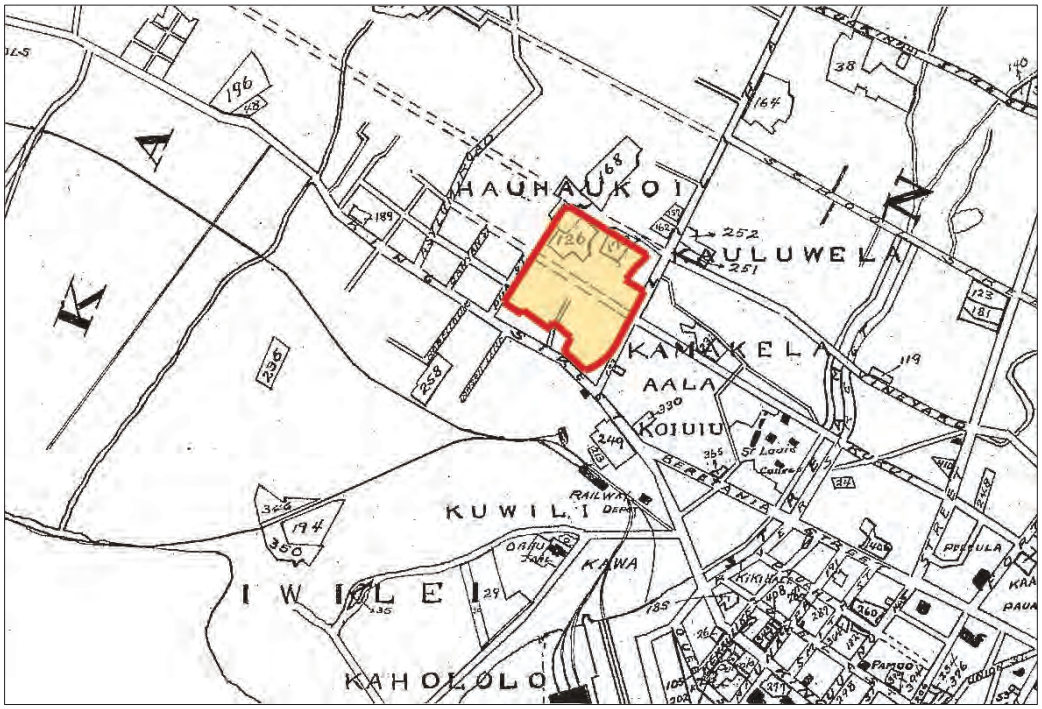

Figure 20. Portion of 1901 (Monsarrat) map showing neighborhoods and blocks with Hawaiian place names and formalization of many streets; note, Queen Lili'uokalani's place is no longer depicted on this map (source: UH-Mānoa MAGIS digital collections)

Figure 21. Series of 1906 Dakin fire insurance maps (stitched together); Liliha Street at bottom of image, Pua Lane at top; note large area dedicated to taro and "market gardens"; see text for other details (source: UH-Mānoa MAGIS digital collections)

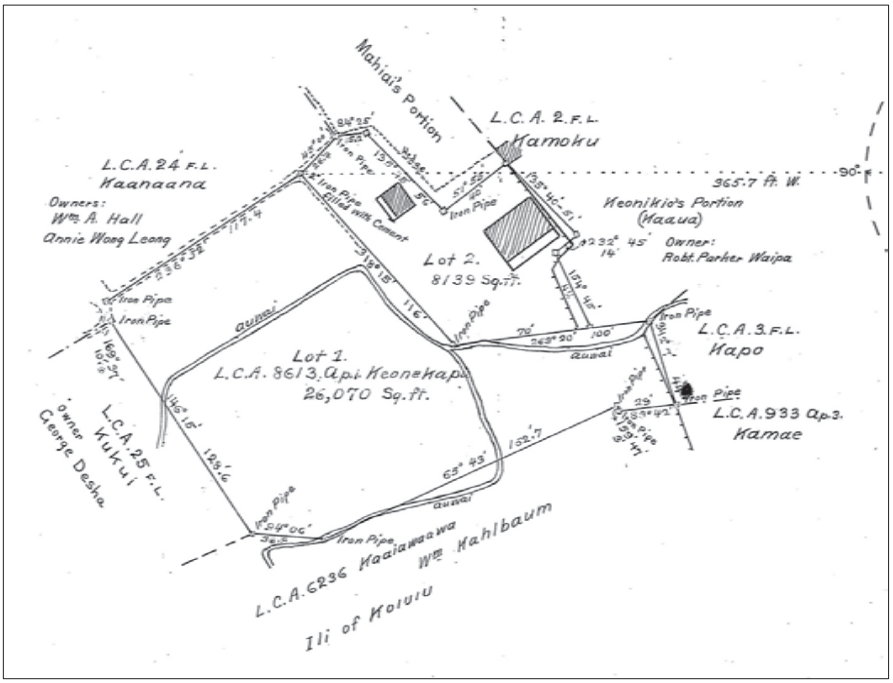

Figure 22. Portion of 1909 survey map from Land Court Application 170 showing several surrounding LCAw (kuleana parcels); note 'auwai system entering from mauka side; intersection of Liliha and Vineyard is just outside of the image to the lower right (source: DAGS Land Survey website)

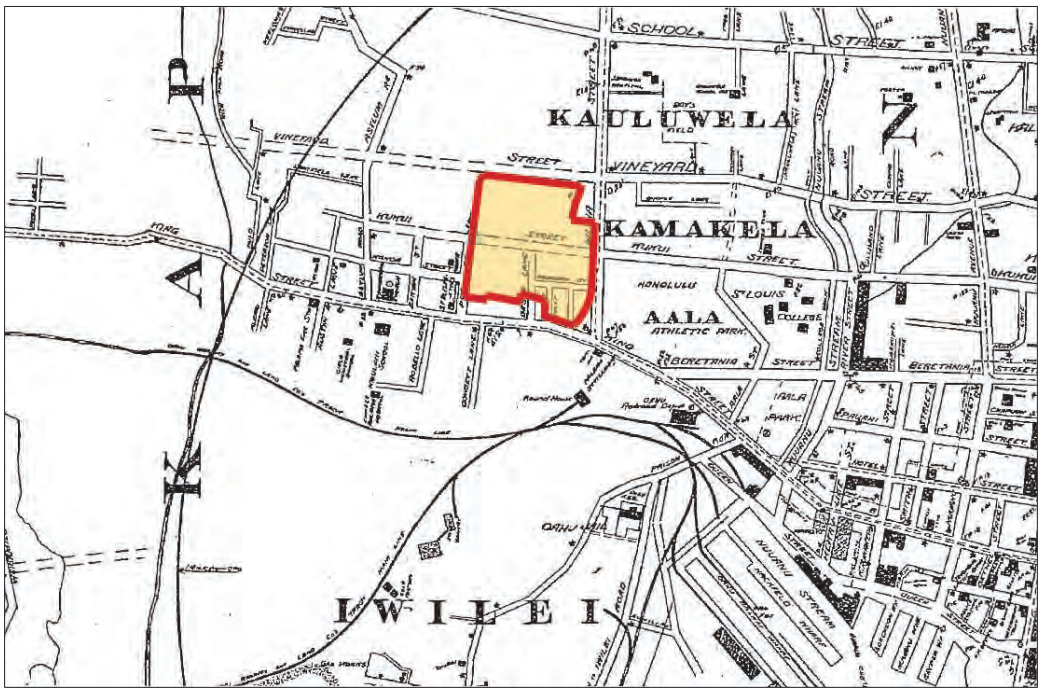

Figure 23. Portion of 1912 (Monsarrat) map showing neighborhoods and blocks with Hawaiian place names and formalization of streets within the project area (source: UH-Mānoa MAGIS digital collections)

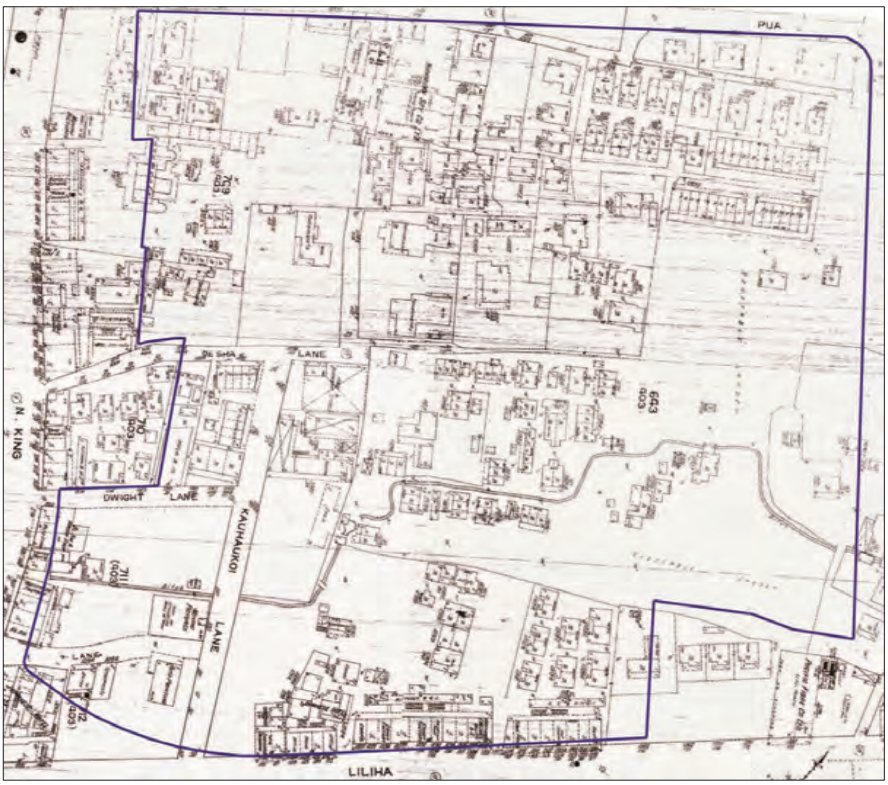

Figure 24. Series of 1914 Sandborn fire insurance maps (stitched together); Liliha Street at bottom of image, Pua Lane at top; note reduction in cultivated gardens area; see text for other details (source: UH-Mānoa MAGIS digital collections)

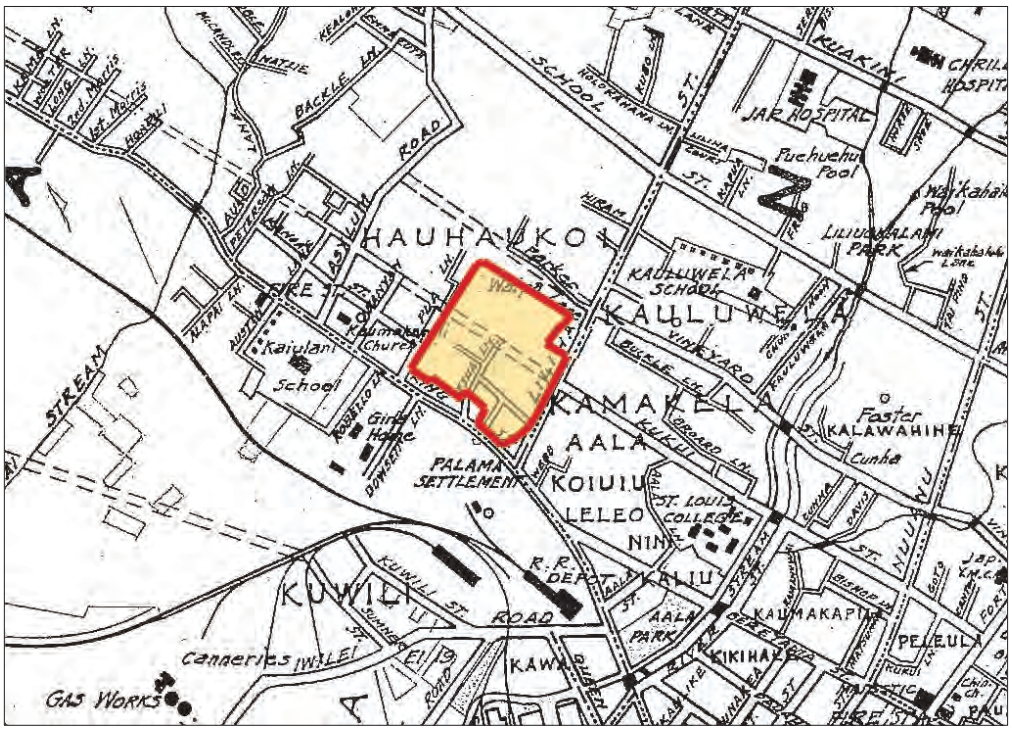

Figure 25. Portion of 1920 (Monsarrat) map showing neighborhoods and blocks with Hawaiian place names, and new ones just southeast of project area; note location of Palama Settlement south of King St. (source: UH-Mānoa MAGIS digital collections)

Figure 26 is a portion of a 1920 Land Court Application 463 map showing several surrounding kuleana parcels (Land Commission Awards), and illustrating the continuing presence of an ‘auwai system and rectangular garden plots in portions of the current project area. By this time, it is likely that these gardens, were at least in part, were growing commercial crops and not just subsistence foods.

Figure 27, a series of 1927 Sandborn fire insurance maps (stitched together), shows a substantial reduction in the amount of area devoted to cultivated gardens. By this time, apartment structures (tenements) had taken over nearly all of the project area with just a couple commercial operations remaining along Liliha and Pua Lane. A dance hall replaced the previous location of the auto painting structure, and a Filipino Missions and Social Club appeared in the corner parcel—just outside the project area, at the intersection of Liliha and Vineyard.

Figure 28, a comparison of 1927, 1933 and 1943 USGS topographic maps of the project area shows no changes in the project area during this time, which is not accurate. It also fails to depict most of the structures known to be in the project area based on the fire insurance maps. This is a cautionary lesson for interpreting such maps as indicting the lack of structure in maps of Honolulu at this (early to middle twentieth century) time.

Figure 29 is a 1939 map of site conditions. Along with Figure 30, a portion (detail) of a 1940 aerial photograph including the project area block about a decade prior to construction of Mayor Wright Homes, illustrates the continuing trend towards apartment buildings and residential structures.

Figure 31, a series of 1947 Sandborn fire insurance maps (stitched together), shows extensive razing (demoliton) of structures compared with 1927 maps, presumably in antipication of the Mayor Wright Homes development.

Figure 32 is a portion (detail) of a 1952 aerial photograph including the project area block during (in-progress) construction of Mayor Wright Homes.

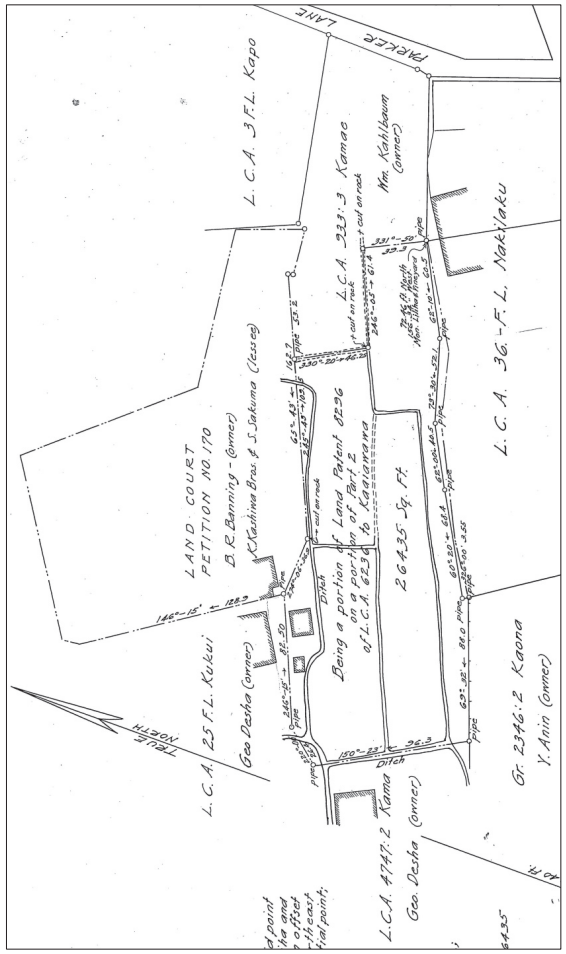

Figure 26. Portion of 1920 Land Court Application 463 showing several surrounding LCAw (kuleana parcels); note ‘auwai system and rectangular garden plots; intersection of Liliha and Vineyard is just outside of the image to the lower right (source: DAGS Land Survey website)

PREVIOUS ARCHAEOLOGICAL RESEARCH

In this section, we summarize relevant previous archaeological studies in order to reconstruct human use and modification of the land in the current project area. The primary objective of this section is to document the types and distribution of archaeological sites we expected to encounter in the project area, and, dependent upon our findings, to help interpret what we did find. In concert with the Historical Context presented above, the information in this section forms the basis of our predicted findings that are included in the next section.

Given the age of the existing Mayor Wright Homes, which was constructed in the early 1950s (before the adoption of applicable historic-preservation and environmental laws starting in the late 1960s), no previous archaeological studies have been conducted in the current project area. Similarly, the immediate surrounding area generally consists of commercial and residential buildings and infrastructure that was completed before the late 1960s. Therefore, with a few prominent exceptions, most of the nearby archaeological studies were conducted in support of roadway, utilities and other infrastructure improvements.

As discussed in detail below, a prominent, recent exception to this is an Archaeological Inventory Survey (AIS) by Cultural Surveys Hawai‘i (Belluomini et al. 2016) of the American Savings Bank property across from ‘A‘ala Park, approximately 400 meters (1,312 ft.) east-southeast of the current project area. A large number of studies were conducted in Chinatown, on the east side of Nu‘uanu Stream. Major archaeological studies were conducted in association with block developments in the 1990s at the River-Nimitz redevelopment, Kekaulike project, Marin Tower project and Liliha Civic Center.

Figure 33 is a graphic depiction of previous archaeological studies near the project area from a recent (2016) SHPD-approved AIS report (Belluomini et al. 2016:40). Figure 34 shows previously-identified archaeological sites—including burials—near the current project area from the same resource (ibid.:41). Appendix B contains a table of previous archaeological studies and results from near the project area from the same study (ibid.).

Two fishponds—Kuwili (Site 5368) and Kawa (Site 5966)—were once located immediately south of the current project area. These fishponds were depicted on an 1855 map (see Figure 11), but appeared to have been filled in by at least 1878 (see Figure 15).

The closest burial site to the current project area (Site 7933) was recently documented by Belluomini et al. (2016) at the American Savings Bank property. A cluster of at least seven individuals, along with some pig and dog bones possibly representing buried animals associated with the human burials, was identified within a Land Commission Award (731 to Palile). The age of this site was interpreted as pre-Contact to post-Contact. All other known burials from the area are located on the other (east) side of the Nu‘uanu Stream (a set of fragmentary human skeletal remains with no site number assigned at Foster Botanical Gardens; and numerous burials sites in Chinatown).

The closest previously-identified historic property to the current project area is a remnant of historic-period trolley (Site 5942) in the middle of King Street just south of its intersection with Liliha Street.

In addition to the burial cluster (Site 7933) found at the American Savings Bank project area, Belluomini et al. (2016) also documented the structural remains of LCA boundary walls (Site 7933) and the structural remains of a building foundation (Site 7935).

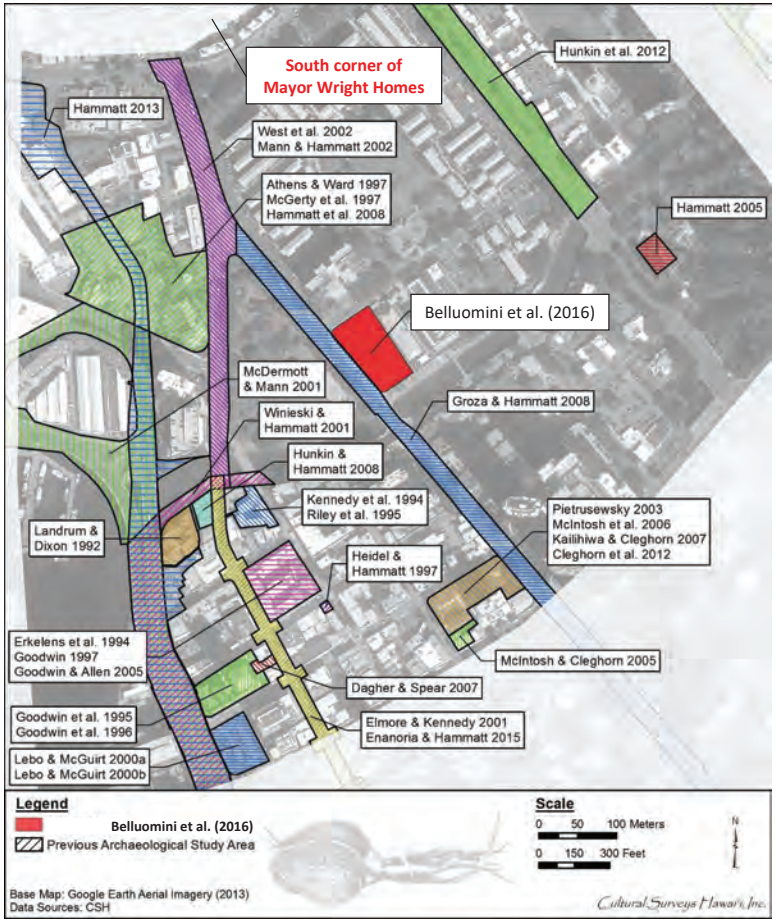

Figure 33. Cultural Surveys Hawai‘i (2016:40) depiction of previous archaeological studies near the current project area; portion of current project area in upper left of this image; image slightly modified/annotated by TCP Hawai‘i

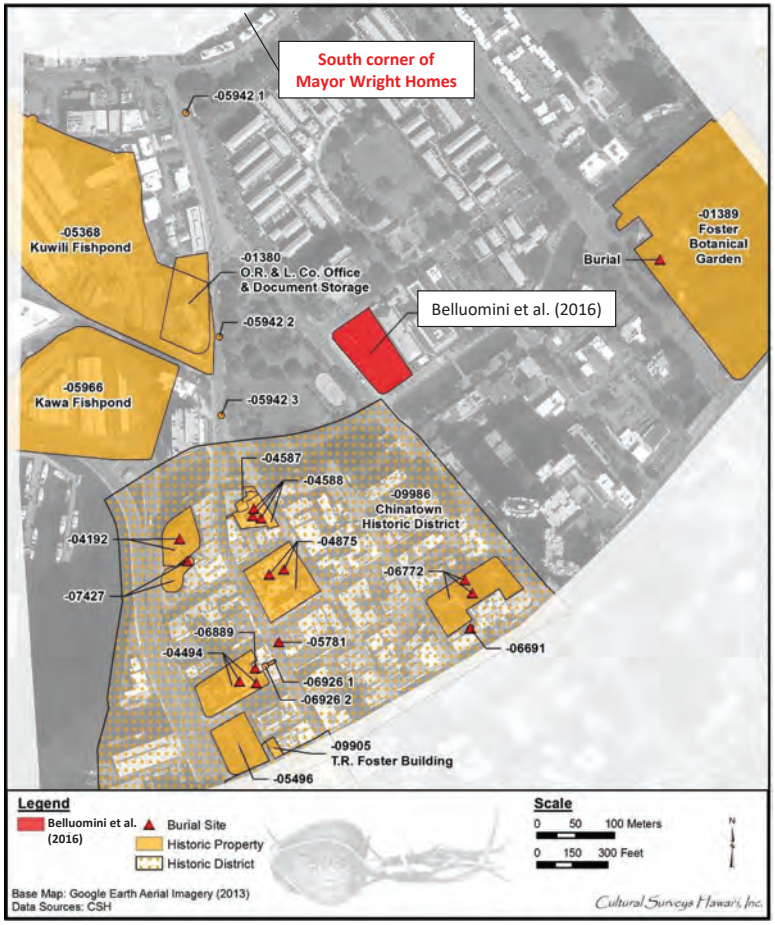

Figure 34. Cultural Surveys Hawai'i (2016:41) depiction of known archaeological sites near the current project area; portion of current project area in upper left of this image; image slightly modified/annotated by TCP Hawai'i

PREDICTED FINDINGS OF THE AIS

Based on all available archival evidence, including historical maps and other documents, cultural knowledge about the project area, previous archaeological studies, and the current conditions at Mayor Wright Homes, we developed the following predictions about what we expected to find during this AIS investigation.

First, there is extensive and varied evidence that in pre-Contact times the project area represented the center of a prime lo'i kalo (pond-field taro cultivation) area (see 1817 map, Figure 9, and 1855 map, Figure 11), which would have included a network of small gardens, numerous 'auwai (traditional irrigation ditches), and low berms or retaining walls of soil and/or rock. Based on the extensive evidence for kuleana parcels (Land Commission Awards) in the project area, several small house sites would have also been present. Historical information, especially a series of fire insurance (cf. Dakin, 1906, and Sandborn, 1914, in particular) maps, suggest large portions of the project area were still being used for taro and other gardens well into the early twentieth century. We believe the project area was unlikely to have been used for pre-Contact burials, given its very high agricultural value, but that historic-period burials associated with kuleana parcels were likely. *The outstanding issue to be addressed by our fieldwork efforts was to determine if any of these traditional features (agricultural fields and structures, 'auwai, house sites, and/or burials), whether whole or in part, remains in the project area.*

Second, a large residential complex belonging to Queen Lili'uokalani is depicted on maps dating from the late nineteenth century in the southwest corner of the project area. The earliest map depiction from 1887 by Wall (see Figure 17) actually labelled it incorrectly (attributing the structure to Princess Ruth Ke'elikōlani, who had a place on the other side of Pua Lane to the west of the project area). In any case, as discussed in detail by Kam (2013), the Queen's residential complex in the project area was modified numerous times until it was eventually turned into tenements by the turn of the twentieth century (the last map that included it was from 1897; by 1901 it was no longer labelled as such). *We positioned an excavation (Trench #2) at the last known positon of the Queen's complex in order to see if any subsurface remnants were left.*

Third, based on numerous fire insurance and other survey maps (see Figure 21, Figure 23 through Figure 25, and Figure 27) from around the turn of the twentieth century—just after 1900—many residential, commercial and light industrial structures were built in the project area. Maps from 1906 and 1914, for example, show a large soy factory (Hawaiian Soy Co., Ltd.) along Pua Lane, a small church (Palama Christian Church, in 1906, which turned into an auto painting operation by 1914), laundries, a Japanese hotel, and small "factories" (to make candy and mattresses) along Liliha, and horse stables. A fire insurance map from 1927 shows that residential structures (tenements) took over nearly all of the project area with just a couple commercial operations remaining along Liliha and Pua Lane. A dance hall replaced the previous location of the auto painting structure, and a Filipino Missions and Social Club appeared in the corner parcel—just outside the project area, at the intersection of Liliha and Vineyard. A 1947 map (see Figure 31) shows significant razing (demolition and removal) of structures throughout much of the project area occurred, presumably as a precursor to the impending Mayor Wright construction. It is very likely that the vast majority of the structures depicted on all these maps from 1906 to 1947 were built on simple blocks (sometimes referred to as "tofu blocks" in Honolulu), and that very few substantial slabs or foundations were ever present. *Therefore, we did not expect to find major, intact evidence of foundations or slabs in the project area from the first half of the twentieth century, although the possibility of some, scattered remnants could not be ruled out.*

Finally, an aerial photograph taken in 1952, apparently during construction of the partially-completed Mayor Wright homes (see Figure 32), appears to show that the entire project area had been levelled (graded/bulldozed), having removed all prior surface structures. *We, therefore, expected to find a widespread layer of some kind dating from the circa 1952 (or slightly earlier) time*.

FIELDWORK RESULTS

We documented four (4) historic properties: State Inventory of Historic Places (SIHP) # 50-80-14-8033, 8034, 8035 and 8036. **Site 8033**—exposed in nearly all (21 of 24) trenches—is a subsurface layer, consisting of four (4) features (the widespread layer, itself, and three filled-in pits emanating from the base of the layer). It represents a project-area wide grading/bulldozing and pit-filling (dumping) event that occurred just prior to, and in preparation for, construction of the Mayor Wright Homes (circa 1952-3). **Site 8034**—exposed in several trenches in the mauka (inland) portion of the project area (Trench #s 6, 7, 10, 15 & 17) is a subsurface layer consisting of gray clay interpreted as pond sediments, most likely the remnants of traditional Hawaiian loʻi kalo (irrigated, pond-field, taro cultivation). There is abundant historical evidence that, in pre-Contact times—before the development of Honolulu Harbor in the early nineteenth century—the project area represented a prime location for traditional Hawaiian subsistence cultivation of taro; such activities continued in some portions of the project area into the early twentieth century. The upper portion of this sedimentary layer—and this site—was partially truncated by the grading/bulldozing. **Site 8035** consists of two features, both asphalt and/or concrete surfaces (exposed in Trench #11 [Feature 1] and Trench #12 [Feature 2]), dating from the late historic/early modern period. Finally, **Site 8036** is a set of very large drainage pipes (exposed in Trench #21) also dating from the late historic/early modern period.

Figure 35 depicts the four (4) historic properties identified in the project area. In the Conclusion section following the Fieldwork and Laboratory Results, we present a detailed table of the identified sites, their significance assessments, and proposed mitigation, as applicable. *A recent (2016) ALTA survey of the current project area depicts the location, orientation and configuration of a large number of walkways and sidewalks, some of which may be in excess of 50 years in age (i.e., they may be historic properties). The ALTA survey map is included in Appendix C. These walkways and sidewalks may be considered components of the above-ground, architectural landscape, but we do not deal with them in this AIS.*

Geoarchaeological/Sedimentary Observations

Several geoarchaeological observations are worth noting. First, when not disturbed, truncated or removed by historic-period activities, the main soil-sedimentary layer below the uppermost topsoil/fill and above any sterile (C-horizon) sediments is clayey loam. Second, bedrock consists primarily of decomposing basalt, but in several cases it is lithified coral reef. The water table was reached before hitting bedrock, between 220–225 cm (7.2–7.4 ft.), in only two trenches (#s 20 and 21) along the southeast side of the project area. Third, the lithified coral reef was exposed at a relatively shallow depth—less than 1.0 m (3.3 ft.)—in several trenches (#s 1, 2, 3, 4, 5, 6 and 23) along the northwest side of the project area (see Figure 35). This distribution of shallow coral shelf is interesting because it corresponds generally with a feature depicted on von Kotzebue's (georeferenced) 1817 map (see Figure 9), which appears to be an elevated (puʻu-type) landform; it is probably a late Pleistocene formation representing the Waimānalo Sea Stand dating to ~120,000 years before present, when sea levels in Hawaiʻi were ~7.5 m (24.8 ft.) above current levels (Macdonald et al. 1983; Ziegler 2002). Some of these trenches with shallow lithified coral shelf (#s 1, 2, 3, and 5) also had volcanic cinder deposited in channels, cracks and holes atop the coral. Lithified coral reef bedrock was also identified in three trenches in the southeast quadrant of the project area, but at a greater depth (150–230 cm [4.9–7.5 ft.]). Finally, clean beach sand was found in only one trench (#24), as a thin (5-15 cm) band of fill sediments.

Stratigraphic Documentation and Interpretation

As depicted in Table 2, twenty-four (24) trenches were excavated to an average depth of 152 cm (5.0 ft.), and a range of 40–230 cm (1.3–7.5 ft.). Average length of the trenches was 4.5 m (14.8 ft.), with a range of 3.5–6.0 m (11.5–19.7 ft.).

Figure 35. Location of historic properties identified by TCP Hawaiʻi during this AIS and shallow lithified coral reef (brown dashed line) (see text discussion)

Table 2. Summary of Trench Dimensions and Geomorphological Characteristics

#	Max. Length	Max. Depth	BOE Material[2]	Comments
1	5.0 m	170 cm*	Coral shelf	One of several trenches w. cut-and-filled channels into coral bedrock; filled channels include cinder; clay deposit (Layer III) beneath late historic/early modern fill deposit (Layer II)
2	3.7 m	170 cm	Coral shelf	One of several trenches w. cut-and-filled channels into coral bedrock; filled channels include cinder; poss. anthropogenic (agricultural) soil (Layer III) beneath late historic/early modern fill deposit (Layer II)
3	4.2 m	190 cm	Coral shelf	One of several trenches w. cut-and-filled channels into coral shelf (bedrock); filled channels include cinder; late historic/early modern fill deposit (Layer II) rests directly atop cut-and-fill sequence (Layer III)
4	5.0 m	80 cm	Coral shelf	Shallow deposit dominated by late historic/early modern fill (Layer II) atop decomposing coral shelf; Layer II includes lenses and pockets of crushed coral sand
5	4.4 m	95 cm	Coral shelf	One of several trenches w. cut-and-filled channels into coral bedrock; filled channels include cinder; also includes late historic/early modern fill deposit (Layer II)
6	4.0 m	120 cm	Coral shelf	Possible pond or lo‘i kalo sediments (gray clay, Layer III) just beneath late historic/early modern fill deposit (Layer II); pond or lo‘i sediment layer partially disturbed (truncated)
7	4.5 m	200 cm	Decomposing basalt	Possible pond or lo‘i kalo sediments (gray clay, Layer III) just beneath late historic/early modern fill deposit (Layer II); gray clay layer partially disturbed (truncated); evidence of previous disturbance (digging event) and installation of ferrous-metal (abandoned) pipe at 45 cmbs
8	5.0 m	180 cm	Coral shelf	Late historic/early modern fill deposit extends relatively deep (140-155 cmbs), including large amount of ferrous metal & other debris (e.g., metal cables, glass, ceramics); abandoned ferrous metal pipe at 105 cmbs
9	4.0 m	80 cm	Coral shelf	Shallow trench dominated by late historic/early modern fill layer containing a butchered cow bone (femur)
10	4.3 m	100 cm	Decomposing basalt	Possible pond or lo‘i kalo sediments (gray clay, Layer II) just beneath modern fill deposit; pond or lo‘i sediment layer partially disturbed (truncated), and overlying clayey loam (Layer III)
11	4.5 m	40 cm	Old asphalt/ concrete surface	Entire deposit consists of modern fill sediments down to an old asphalt/concrete surface
12	3.5 m	140 cm	Decomposing basalt	Old degraded (decomposing) asphalt surface and crushed-coral base course (25-40 cmbs) located beneath topsoil layer; possible anthropogenic (agricultural) soil (Layer II) beneath old asphalt
13	6.0 m	210 cm	Decomposing basalt	Late historic/early modern fill deposit w. fragments of old-style hollow tiles and a lens of asphalt-like substance at 65-75 cmbs, atop massive, natural clayey loam to bedrock (Layer III)
14	3.7 m	135 cm	Decomposing basalt	Relatively deep (85 to 90-cm thick, 100 cmbs) late historic/early modern fill layer w. abandoned ferrous-metal pipe near base of deposit, overlying natural clayey loam (below 85-100 cmbs)
15	5.0 m	128 cm	Decomposing basalt	Possible pond or lo‘i kalo sediments (gray clay, Layer III) just beneath late historic/early modern fill deposit (Layer II); pond or lo‘i sediment layer partially disturbed (truncated)
16	5.0 m	135 cm	Decomposing basalt	Deposit dominated by fill down to 85-110 cmbs; natural clay (Layer III) at base of deposit, under late historic/early modern fill deposit (Layer II); previous utility excav. & 2-inch ferrous-metal pipe at 100 cmbs
17	4.0 m	210 cm	Decomposing basalt	Possible pond or lo‘i kalo sediments (gray clay, Layer III) just beneath late historic/early modern fill deposit (Layer II)
18	4.2 m	230 cm	Coral shelf	Series of natural layers fining downward from silty alluvium (Layer III) atop saprolitic clayey loam (Layer IV) atop sterile clay (Layer V, C-horizon), all beneath late historic/early modern fill deposit (Layer II)

#	Max. Length	Max. Depth	BOE Material[2]	Comments
19	4.5 m	150 cm	Coral shelf	Entire deposit down to coral shelf (bedrock) is fill
20	4.0 m	220 cm	Water table	Entire deposit down to decomposing basalt (bedrock) is fill
21	4.4 m	225 cm	Water table	Late historic/early modern fill deposit (Layer II) caps a pair of older, very large (approx. 3-ft diameter) drainage pipes; laterally-equivalent with the drainage pipes is a disturbed layer (III) with ferrous metal and red brick; disturbed deposit (Layer III) extends down to 135 cmbs; pocket of cinder at approx. 200 cmbs
22	5.0 m	180 cm	Coral shelf	Lower half of deposit is natural alluvium; fill stratum (Layer III) beneath late historic/early modern deposit (Layer II) contains an abandoned ferrous-metal pipe
23	4.0 m	65 cm	Coral shelf	Nearly entire deposit consists of disturbed sediments with active utilities (e.g., a 3-inch diameter copper pipe) and old (abandoned) communications wire (low voltage) exposed in excavation; very thin (5-10 cm thick) band of natural sediments (cinder and clay) exposed in north end of trench
24	5.0 m	200 cm	Decomposing basalt	Lower two-thirds of deposit (Layer III) is natural alluvium; late historic/early modern deposit (Layer II) is capped by a narrow (5-15 cm thick) layer of loose beach sand (Layer Ic), the only such sand in project area

[1] # = Trench #

[2] BOE (base of excavation) material refers to bedrock type, except in a small number of cases where the water table was reached first

* Base of excavation extended into lithified coral shelf (bedrock) in order to explore these sediments; actual maximum depth of bedrock (coral shelf) = 130 cmbs

Trench #1

Along with a few other trenches (i.e., Trench #s 2, 3 and 5) in the west corner and along the west side of the project area (see Figure 7), Trench #1 exposed a lithified coral shelf (bedrock) incised by water flowing through well-defined channels that had been filled in with alternating deposits of cinder and clay. Most of the channels occur at about 1.0 m below the ground surface (except for the shallower Trench #5). When we first encountered such evidence (in Trench #2), we carefully considered and explored the possibility that the channels we were observing were ʻauwai (irrigation ditches for cultivated fields) or some other humanly-created feature. After careful observation, cleaning of the profile walls by hand, and consideration of the entire sedimentary deposit in these trenches, we are certain they are natural features of a landscape that predate human settlement of Oʻahu by thousands of years. The cinder likely derives from the well-documented eruption of Pūowaina (Punchbowl) approximately 8,000 years ago.

Figure 36 and Table 3 document and depict the soil-stratigraphic layers exposed in excavation at Trench #1. Figure 37 and Figure 38 are overview photographs of Trench #1 at the base (completion) of excavation at 90-170 cm below ground surface (cmbs). Bedrock consists of undulating, lithified coral reef (shelf). In order to explore and understand this lowermost sedimentary unit, we excavated into some of the coral reef (see Figure 36).

Figure 39 to Figure 41 show details of the soil-stratigraphy, which generally consists of the following sequence: a typical topsoil (Layer I) directly atop a fill (Layer II) containing late historic to early modern debris (details below), over a natural clay deposit (Layer III), atop a cut-and-fill sedimentary unit of clayey loam (Layer IVa) with lenses and pockets of loose cinder (Layer IVb) and extremely consolidated clay (Layer IVc) channel fill over the coral-shelf (Layer V). The clayey loam, cinder and clay were likely deposited into the channels atop the lithified reef by flowing water.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. The only cultural material observed in Trench #1 consisted of non-diagnostic, fragmentary late historic/early modern debris, including small pieces of ferrous metal, glass, bricks, hollow tile and ceramics in Layer II.[4] Based on observations throughout the project area, this layer represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

[4] It is important to note that temporally-diagnostic materials—consisting primarily of glass bottles with maker's marks and other indicators of time and place of manufacture—were recovered in numerous other trenches from this same, laterally-equivalent stratum (Layer II). Specific evidence of these temporally-diagnostic materials is presented in detail in the Laboratory Results section following this Fieldwork Results section.

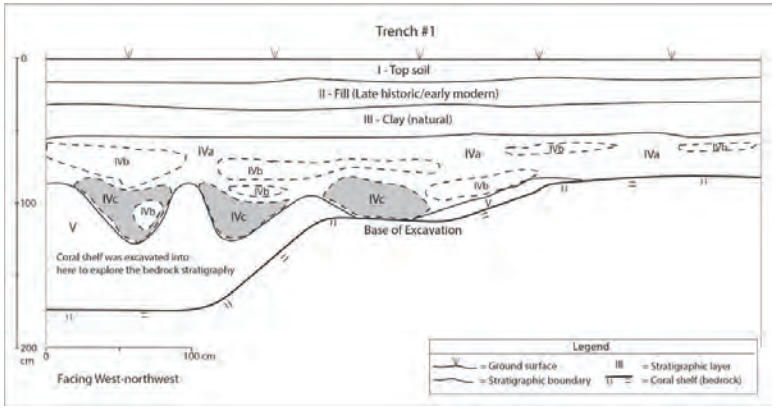

Figure 36. Stratigraphic profile of Test excavation (Trench) #1

Table 3. Summary of Soil-stratigraphic Units in Trench #1

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
I	0-12/15	12-15	Dark brown 7.5YR 3/2 sandy loam w. abundant very small inclusions of shell, lithified coral; loose consistency; soil peds; very few pebble-sized rocks	Modern trash
II	12/15-30/35	18-20	Dk brown 10YR 3/3 clayey loam w. inclusions of crushed coral, mottling of reddish-brown (ferrous metal remnants); hard consistency; little to no soil structure; jumbled inclusions; some pebble- and cobble-sized rocks	Fill layer w. late historic/early modern debris including small, non-diagnostic fragments of ferrous metal, glass, bricks, hollow tile and ceramics
III	30/35-50/55	22-25	Dark brown 7.5YR 3/2 very consolidated clay w. occasional fine sand inclusions; extremely hard consistency; rock free	Natural clay layer; no cultural material
IVa	50/55-85/120	30-70	Dark brown 7.5YR 3/4 clayey loam w. abundant, typical, multi-colored saprolitic mottling; loose, unconsolidated consistency; rock free	Natural layer, no cultural material; thickness and depth vary dramatically due to undulating coral shelf underneath
IVb	60-110	5-27	Multi-colored cinder; loose, structureless lenses and pockets	Natural layer, no cultural material; cinder occurs as lenses and pockets within Layer IVa
IVc	85-120	20-30	Dark reddish-brown 5YR 3/2 extremely hard clay; no inclusions; fills in bottoms of channels in coral shelf; rock free; abundant micro-mottling/inclusions	Natural layer, no cultural material; clay occurs as channel fill within Layer IVa
V	85-Unknown	Unknown	Relatively friable lithified reef	Lithified coral reef (bedrock)

Figure 38. Overview of Trench #2 at base of excavation, view southwest; note shallow coral shelf in foreground base of the trench

Figure 39. Detail of south half of northwest-facing profile of Trench #1, view east; note channels and channel-fill sediments

Figure 40. Another view of south half of northwest-facing profile of Trench #1, view southeast; note channels cut into coral shelf and channel-fill sediments of cinder and clay

Figure 41. Detail of a portion of southeast-facing profile of Trench #1, view northwest; note channels cut into coral shelf and channel-fill sediments of cinder and clay

Trench #2

Along with a few other trenches (i.e., Trench #s 1, 3 and 5) in the west corner and along the west side of the project area (see Figure 7), Trench #2 exposed a lithified coral shelf (bedrock) incised by water flowing through well-defined channels that had been filled in with deposits of cinder and terrigenous sediment. The main channel into the lithified coral (bedrock) at Trench #2 starts at 85-90 cmbs. Based on the order in which they were excavated, Trench #2 was the first such example where we observed well-defined channels; and our initial hypothesis—that they might represent ʻauwai or some other humanly-created feature—was investigated by careful observation, cleaning of the profile walls by hand, and consideration of the entire sedimentary deposit. Based on all available evidence, we are certain they are natural, early Holocene features of a landscape that predate human settlement of Oʻahu.[5]

Figure 42 and Table 4 document and depict the soil-stratigraphic layers exposed in excavation at Trench #2. Figure 43 is an overview photograph of Trench #2 at the base (completion) of excavation at a maximum depth of 170 cmbs. Bedrock consists of undulating, lithified coral reef (shelf). In portions of the trench where it has not been incised (channelized), the coral shelf (bedrock) is only 80-85 cm deep.

Figure 44 and Figure 45 show details of the soil-stratigraphy, which generally consists of the following sequence: a typical topsoil (Layer I) directly atop a fill (Layer II) containing late historic to early modern debris (details below), over a loamy deposit (Layer III) that appears to be an old agricultural soil (i.e., an anthropogenic stratum), atop a cut-and-fill sequence unit of clayey loam (Layer IVa) that was cut into (incised) by cinder (Layer IVb). Both the clayey loam and cinder were likely deposited by flowing water.

The loam deposit (designated Layer III), which appears to be a non-irrigated (non-pond/loʻi) agricultural soil, is similar to one (Layer II) exposed in Trench #12, located just southeast of Trench #2.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. The only cultural material observed in Trench #2 consisted of non-diagnostic, fragmentary late historic/early modern debris, including small pieces of ferrous metal, glass, bricks, hollow tile and ceramics in Layer II. Based on observations throughout the project area, this layer represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments). The possibly anthropogenic soil (Layer III) is also noteworthy.

[5] The cinder likely derives from the well-documented eruption of Pūowaina (Punchbowl) approximately 8,000 years ago.

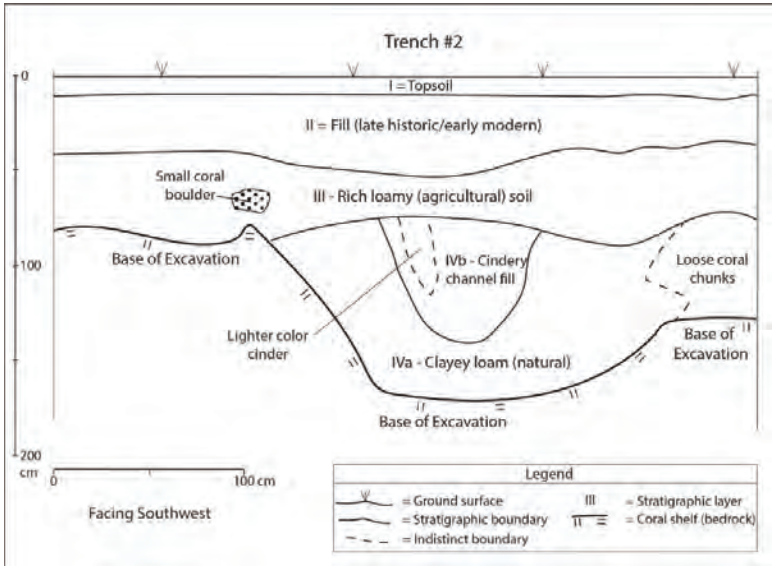

Figure 42. Stratigraphic profile of Test excavation (Trench) #2

Table 4. Summary of Soil-stratigraphic Units in Trench #2

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
I	0-10	10	Very dark grayish brown 10YR 3/2 loam w. abundant fine to very fine roots; loose consistency; soil peds; very few pebble-sized rocks	Modern trash
II	10-35/55	25-45	Dark brown 10YR 3/3 clayey loam w. inclusions of crushed coral; little to no soil structure; jumbled inclusions (no fining upward sequence); some pebble- and cobble-sized rocks	Fill layer w. late historic/early modern debris including small, non-diagnostic fragments of ferrous metal, glass, bricks, hollow tile and ceramics
III	35/55-70/90	20-50	Dk brown 10YR 2/2 loam (organic rich); mod. loose/unconsolidated consistency; crumb structure w. soil peds	Natural layer, consistent w. rich agricultural soil; no cultural material
IVa	75/90-170	~100	Dk brown 7.5YR 3/4 clayey loam; moderately hard consistency; occasional pebble- and cobble-size rocks	Natural layer, no cultural material; this layer is channel fill into coral shelf
IVb	72/80-140	60-68	Multi-colored cinder; loose, structureless lenses and pockets	Natural layer, no cultural material; cinder occurs as channel fill into Layer IVa

Figure 43. Overview of Trench #2 at base of excavation, view northwest; note shallow coral shelf in foreground base of the trench; deeper coral shelf in the middle of the trench is an old channel cut into it

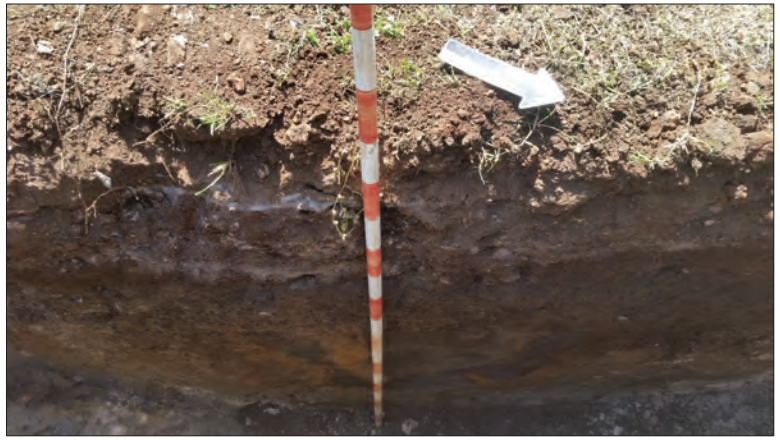

Figure 44. Detail of a portion of the northeast-facing profile wall at Trench #2 at base of excavation, view southwest; note cindery channel fill in bottom center of profile

Figure 45. Detail of a portion of southwest-facing profile wall at Trench #2, including east end, view east

Trench #3

Along with a few other trenches (i.e., Trench #s 1, 2 and 5) in the west corner and along the west side of the project area (see Figure 7), Trench 3 exposed a lithified coral shelf (bedrock) incised by water flowing through well-defined channels that had been filled in with deposits of cinder and terrigenous sediment. Channeling into the lithified coral (bedrock) in Trench #3 starts at 95 cmbs in its northeast end. Based on all available evidence—as described in more detail above (see Trench #1 and #2 narrative description), we are certain these deposits are natural, early Holocene features of a landscape that predate human settlement of O'ahu.

Figure 46 and Table 5 document and depict the soil-stratigraphic layers exposed in excavation at Trench #2. Figure 47 is an overview photograph of Trench #3 at the base (completion) of excavation at a maximum depth of 190 cmbs. Bedrock consists of undulating, lithified coral reef (shelf). In order to explore and understand this lowermost sedimentary unit, we excavated into some of the coral reef (see Figure 46).

Figure 48 and Figure 49 show details of the soil-stratigraphy, which generally consists of the following sequence: a shallow (5-cm thick) topsoil (Layer Ia) directly atop two modern fill deposits (a thin gray cinder, Layer Ib, and a thicker sandy loam, Layer Ic); these modern deposits cap a late historic to early modern fill (Layer II, details below), over a cut-and-fill sequence unit of clayey loam (Layer IIIa) with lenses and pockets of loose cinder (Layer IIIb) and extremely consolidated clay (Layer IIIc) channel fill over the coral-shelf (Layer IV). Both the clayey loam and cinder were likely deposited by flowing water.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. The only cultural material observed in Trench #3 consisted of non-diagnostic, fragmentary late historic/early modern debris in Layer II, including small pieces of ferrous metal and abundant fragments of hollow tile. Based on observations throughout the project area, this layer represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

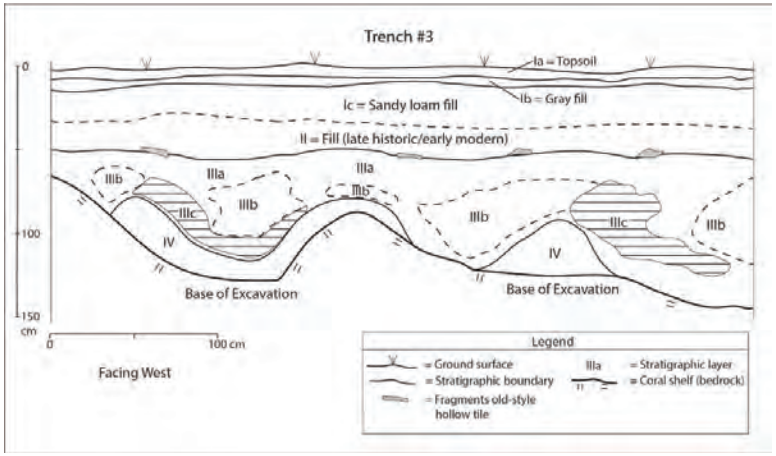

Figure 46. Stratigraphic profile of Test excavation (Trench) #3

Table 5 Summary of Soil-stratigraphic Units in Trench #3

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
Ia	0-5	5	Very dark grayish brown 10YR 3/2 loam w. abundant fine to very fine roots; loose consistency; few pebble-sized rocks	Modern trash
Ib	5-10	5	Light gray 10YR 7/1 cinder; very loose consistency; no rocks	Fill layer (modern)
Ic	10-30	20	Dk brown 7.5YR 3/3 sandy loam w. v. few inclusions; no rocks; structureless	Fill layer (modern)
II	30-50/55	20-25	Dark brown 10YR 3/3 sandy loam w. inclusions of crushed coral; little to no soil structure; jumbled inclusions (no fining upward sequence); some pebble- and cobble-sized rocks	Fill layer w. late historic/early modern debris including small, non-diagnostic fragments of ferrous metal and abundant old-style hollow tile
IIIa	50/55-80/140	40-90	Dark brown 7.5YR 3/4 clayey loam w. abundant, typical, multi-colored saprolitic mottling; loose, unconsolidated consistency; rock free	Natural layer, no cultural material; thickness and depth vary dramatically due to undulating coral shelf underneath
IIIb	60/65-80/110	15-30	Multi-colored cinder; loose, structureless lenses and pockets	Natural layer, no cultural material; cinder occurs as lenses and pockets within Layer IIIa
IIIc	70-110	10-30	Dark reddish-brown 5YR 3/2 extremely hard clay; no inclusions; fills in bottoms of channels in coral shelf; rock free	Natural layer, no cultural material; clay occurs as channel fill within Layer IIIa
IV	75/80-Unknown	Unknown	Relatively friable lithified reef	Lithified coral reef (bedrock)

Figure 47. Overview of Trench #3 at base of excavation, view northeast; note undulating, relatively shallow coral shelf in base of trench and cindery sediment at far (east) end

Figure 48. Detail of a portion of the southeast-facing profile wall at Trench #3 at base of excavation, view northwest; note cindery channel fill atop coral shelf

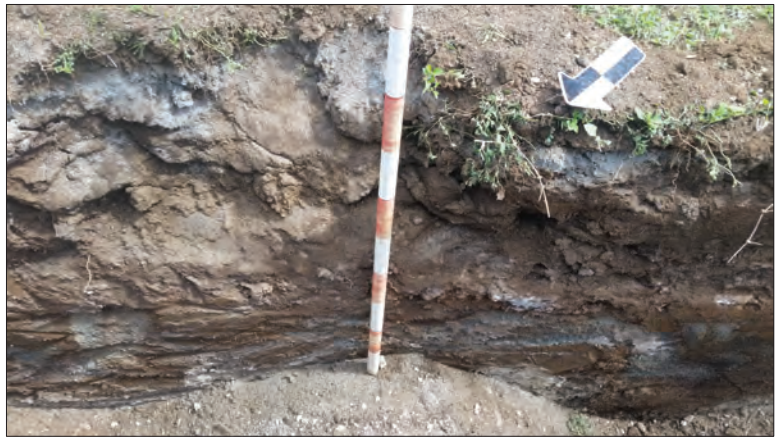

Figure 49. Detail of a portion of the northwest-facing profile wall at Trench #3 at base of excavation, view southeast; note cindery channel fill atop coral shelf

Trench #4

The entire deposit in Trench #4 consists of fill sediments and disturbance dating from no earlier than the late historic/early modern period.

Figure 50 and Table 6 document and depict the soil-stratigraphic layers exposed in excavation at Trench #4. Figure 51 is an overview photograph of Trench #4 at the base (completion) of excavation at a maximum depth of 75 cmbs. Bedrock consists of lithified coral reef (shelf). It appears that previous disturbance of this coral shelf, approximately 20-25 cm in thickness, has taken place in the past (see Figure 50).

Figure 52 and Figure 53 show details of the soil-stratigraphy, which generally consists of the following sequence: a shallow (7 to 8-cm thick) topsoil (Layer I) directly atop a late historic to early modern fill (Layer II, details below), over a relatively shallow layer of friable, broken up, lithified coral reef (cobble- and pebble-sized clasts). This Layer (III) possibly represents an artificial (i.e., humanly-created) deposit of coral fragments from previous disturbance/excavation of the underlying coral bedrock.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. The only cultural material observed in Trench #4 consisted of non-diagnostic, fragmentary late historic/early modern debris in Layer II, including small pieces of ferrous metal and abundant fragments of glass. Several lenses and pockets of crushed coralline sand were observed in this layer. Based on observations throughout the project area, Layer II represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

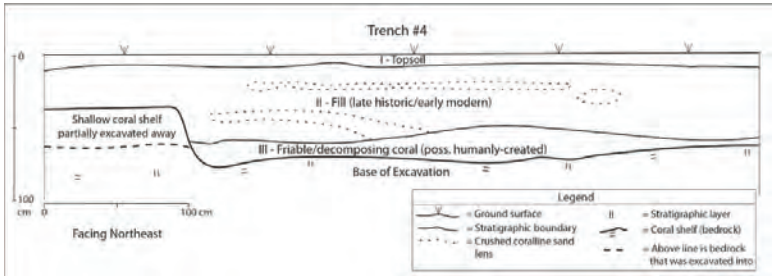

Figure 50. Stratigraphic profile of Test excavation (Trench) #4

Table 6. Summary of Soil-stratigraphic Units in Trench #4

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
I	0-10	10	Very dark grayish brown 10YR 3/2 silty loam w. abundant fine to very fine roots; loose consistency; abundant pebble-sized rocks	Modern trash
II	10-35/60	25-50	Dark brown 10YR 3/3 sandy loam w. inclusions of crushed coral; little to no soil structure; jumbled inclusions (no fining upward sequence); some pebble- and cobble-sized rocks	Fill layer w. late historic/early modern debris including small, non-diagnostic fragments of ferrous metal and abundant old-style hollow tile
III	35/60-Unknown	Unknown	Relatively friable, broken up lithified coral reef, cobble- and pebble-sized clasts	Possibly humanly-created coral fragments from previous disturbance/excavation of the underlying coral bedrock

Figure 51. Overview of Trench #4 at base of excavation, view northwest

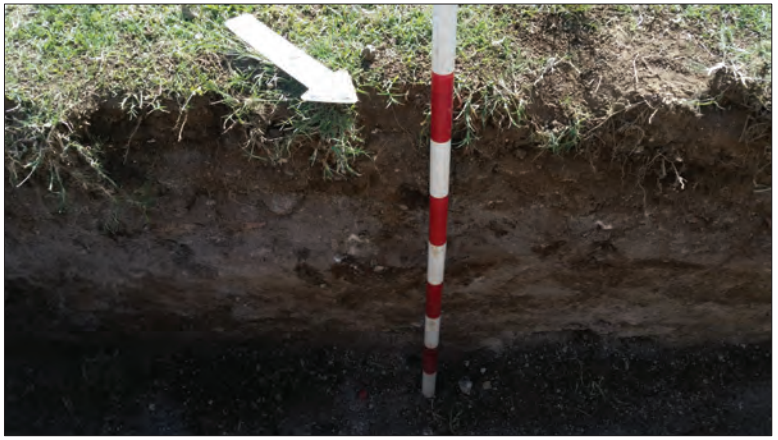

Figure 52. Detail of a portion of the northeast-facing profile wall at Trench #4 at base of excavation, view southwest

Figure 53. Oblique view of a portion of the northeast-facing profile wall at Trench #4 at base of excavation, view southeast

Trench #5

Along with a few other trenches (i.e., Trench #s 1, 2 and 3) in the west corner and along the west side of the project area (see Figure 7), Trench #5 exposed a lithified coral shelf (bedrock) incised by water flowing through well-defined channels that had been filled in with deposits of cinder and terrigenous sediment. Channeling into the lithified coral (bedrock) in Trench #5 starts at 45 cmbs in its northeast end. Based on all available evidence—as described in more detail above (see Trench #1 and #2 narrative description), we are certain these deposits are natural, early Holocene features of a landscape that predate human settlement of O‘ahu.

Figure 54 and Table 7 document and depict the soil-stratigraphic layers exposed in excavation at Trench #5. Figure 55 is an overview photograph of Trench #5 at the base (completion) of excavation at a maximum depth of 95 cmbs. Bedrock consists of undulating, lithified coral reef (shelf).

Figure 56 and Figure 57 show details of the soil-stratigraphy, which generally consists of the following sequence: a topsoil (Layer I) that contains a discontinuous, thin deposit of gray cinder in some places; this modern layer caps a late historic to early modern fill (Layer II, details below), over a cut-and-fill sequence unit of clay (Layer IIIa) with lenses and pockets of loose cinder (Layer IIIb) over the coral-shelf. Both the clay and cinder were likely deposited by flowing water.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. The only cultural material observed in Trench #5 consisted of non-diagnostic, fragmentary late historic/early modern debris in Layer II, including small pieces of ferrous metal and abundant glass fragments. Based on observations throughout the project area, this layer represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

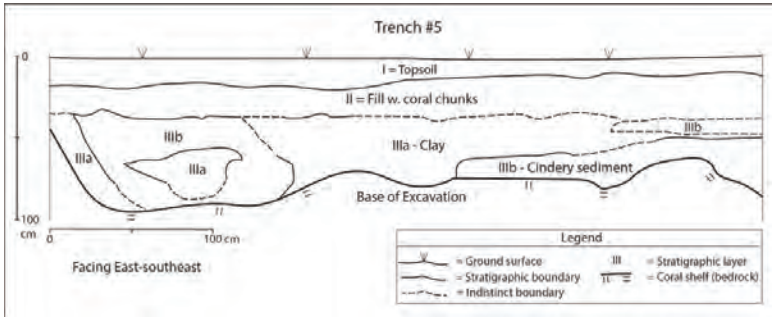

Figure 54. Stratigraphic profile of Test excavation (Trench) #5

Table 7. Summary of Soil-stratigraphic Units in Trench #5

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
I	0-10/15	10-15	Dark brown 10YR 3/3 loam w. soil peds & structure; loose consistency; few pebble-sized rocks	Modern trash
II	10/15-30/35	15-30	Very dark grayish brown 10YR 3/2 clayey loam w. inclusions of crushed coral; platey structure; jumbled inclusions (no fining upward sequence); some pebble- and cobble-sized rocks	Fill layer w. late historic/early modern debris including small, non-diagnostic fragments of ferrous metal and glass
IIIa	35-70/95	35-60	Reddish brown 5YR 4/3 clay w. occasional flecks of charcoal and orange-reddish very small mottling; very hard/compact consistency	Natural layer, no cultural material; thickness and depth vary dramatically due to undulating coral shelf underneath
IIIb	35-70/95	10-65	Multi-colored cinder; compact consistency, structureless lenses and pockets	Natural layer, no cultural material; cinder occurs as lenses and pockets within Layer IIIa; thickness and depth vary dramatically

Figure 55. Overview of Trench #5 at base of excavation, view southwest

Figure 56. Detail of a portion of the southeast-facing profile wall at Trench #5 at base of excavation, view northwest

Figure 57. Detail of a portion of the northwest-facing profile wall at Trench #5 at base of excavation, view southeast

Trench #6

Trench #6 exposed a possible pond or lo‘i kalo layer (gray clay) between 55-80 cmbs, below a late historic/early modern fill layer (see Figure 7).

Figure 58 and Table 8 document and depict the soil-stratigraphic layers exposed in excavation at Trench #6. Figure 59 and Figure 60 are overview photographs of Trench #6 at the base (completion) of excavation at a maximum depth of 120 cmbs. Bedrock consists of gently undulating, lithified coral reef (shelf).

Figure 61 and Figure 62 show details of the soil-stratigraphy, which generally consists of the following sequence: a relatively deep (20-25-cm thick) topsoil (Layer I) atop a late historic to early modern fill (Layer II, details below), over a distinctive gray clay (Layer III) that appears to represent ponded sediments—perhaps lo‘i kalo; beneath this gray clay is a clayey loam (Layer IV) with pedogenic properties that may be an agricultural soil. Beneath this possible agricultural soil is an extremely consolidated (hard consistency) clay alluvium (Layer V) resting directly on the coral shelf (bedrock).

As depicted in some of the photographs below (see, e.g., Figure 59 and Figure 61), the gray clay layer (possible pond or lo‘i kalo sediments) was partially truncated (disturbed) by past excavation activities originating from the overlying (Layer II) late historic/early modern deposit. A large section of metal pipe recovered in Layer II (see Figure 63) is an old utility that came from this disturbance.

The possible pond or lo‘i kalo deposit was documented in a total of five trenches (#s 6, 7, 10, 15 and 17). We discuss patterning in geomorphological strata in the Significance Assessments section following the Results.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #6 consisted of late historic/early modern debris in Layer II, including ferrous metal and glass fragments, as well as some larger items including a portion of a leaf-spring-style vehicle suspension and other ferrous metal (section of pipe, rebar) (Figure 63 and Figure 64). Based on observations throughout the project area, this layer represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

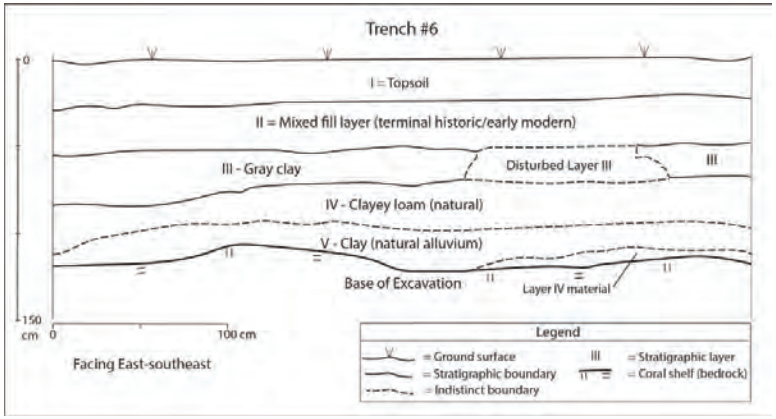

Figure 58. Stratigraphic profile of Test excavation (Trench) #6

Table 8. Summary of Soil-stratigraphic Units in Trench #6

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
I	0-20/25	20-25	Dark brown 7.5YR 3/2 loam w. soil peds & structure; loose consistency; few pebble-sized rocks	Modern trash
II	20/25-50	25-30	Dark brown 10YR 3/3 clayey loam w. inclusions of crushed coral; platey structure; mottling of reddish-brown (ferrous metal); some pebble- and cobble-sized rocks	Fill layer w. late historic/early modern debris including ferrous metal and glass; and larger ferrous metal objects (e.g., piece of leaf-spring-style suspension)
III	50-70/80	20-30	Gray 2.5YR 4/1 clay, sticky, very consolidated; no inclusions or mottling	Natural layer – possible pond or lo‘i kalo sediments, no cultural material
IV	70/80-95/110	15-30	Dark brown 10YR 3/3 clayey loam; crumbly structure w. soil peds; moderately loose consistency	Natural layer (possible agricultural soil), no cultural material
V	95/110-115-120	5-20	Grayish brown 10YR 5/2 clay, extremely hard consistency (nearly “rock hard”); “shiny” appearance when cut with metal tool; some reddish-brown flecks and micro-mottling	Natural layer (alluvium), no cultural material – there is a thin band of Layer IV sediment (clayey loam) at the base of a portion of this layer (see Figure 58 and Figure 61)

Figure 59. Overview of Trench #6 at base of excavation, view southwest; arrow indicates disturbance (old excavation) into the gray clay layer (Layer III), as discussed in the text above

Figure 60. Overview of Trench #6 at base of excavation, view northeast

Figure 62. Detail of a portion of northwest-facing profile at Trench #6, near north end of trench, view southeast

Figure 63. Close up of a fragment of leaf-spring-style suspension from an old vehicle recovered from base of Layer II at Trench #6

Figure 64. Various ferrous metal objects (including the leaf-spring fragment pictured above, a section of metal pipe and reinforcement bars) recovered from Layer II in Trench #6; photo shows them tossed back into trench prior to it being backfilled

Trench #7

Trench #7 exposed a possible pond or lo‘i kalo layer (gray clay) between 25-55 cmbs, below a late historic/early modern fill layer (see Figure 7).

Figure 65 and Table 9 document and depict the soil-stratigraphic layers exposed in excavation at Trench #6. Figure 66 and Figure 67 are overview photographs of Trench #7 at the base (completion) of excavation at a maximum depth of 200 cmbs. Bedrock consists of decomposing basalt.

Figure 68 and Figure 69 show details of the soil-stratigraphy, which generally consists of the following sequence: a relatively shallow (10-cm thick) topsoil (Layer I) atop a thin late historic to early modern fill (Layer II, details below), over a distinctive gray clay (Layer III) that appears to represent ponded sediments—perhaps lo‘i kalo; beneath this gray clay is a clayey loam (Layer IV) with pedogenic properties that may be an agricultural soil. Beneath this possible agricultural soil is an extremely consolidated (hard consistency) clay alluvium (Layer V) resting directly on decomposing basalt (bedrock). At the south end of the trench, there is evidence of previous disturbance (digging event) and installation of a ferrous-metal (now abandoned) pipe at 45 cmbs. The previous utility excavation originated from the late historic/early modern deposit (Layer II).

The possible pond or lo‘i kalo deposit was documented in a total of five trenches (#s 6, 7, 10, 15 and 17). We discuss patterning in geomorphological strata in the Significance Assessments section following the Results.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #7 consisted of late historic/early modern debris in Layer II, including ferrous metal and glass fragments. Based on observations throughout the project area, this layer represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

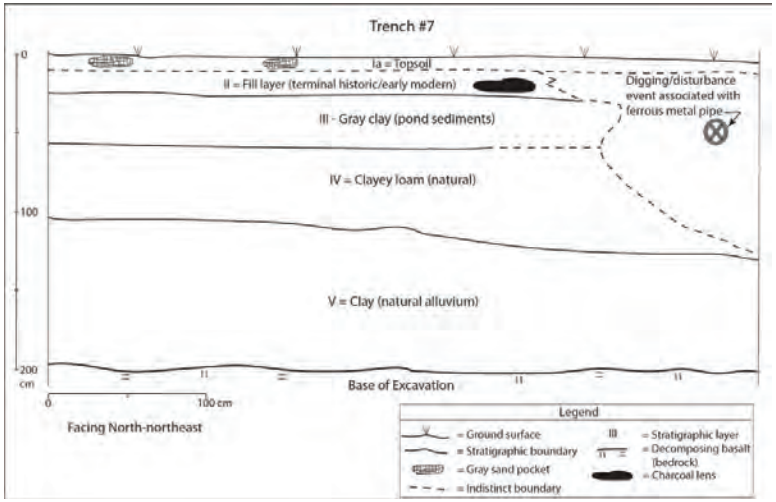

Figure 65. Stratigraphic profile of Test excavation (Trench) #7

Table 9. Summary of Soil-stratigraphic Units in Trench #7

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
I	0-10	10	Dark brown 7.5YR 3/2 loam w. soil peds & structure; loose consistency; few pebble-sized rocks	Modern trash – also includes small lenses/pockets of gray sand
II	10-25*	15*	Dark brown 10YR 3/3 clayey loam w. inclusions of crushed coral; platey structure; mottling of reddish-brown (ferrous metal); some pebble- and cobble-sized rocks	Fill layer w. late historic/early modern debris including ferrous metal and glass – also includes a small wood charcoal deposit at 15 cmbs
III	25-55	30	Gray 2.5YR 4/1 clay, sticky, very consolidated; no inclusions or mottling	Natural layer – possible pond or lo‘i kalo sediments, no cultural material
IV	55-100/120	45-65	Dark brown 10YR 3/3 clayey loam; crumbly structure w. soil peds; moderately loose consistency	Natural layer (possible agricultural soil), no cultural material
V	100/120-200	80-100	Grayish brown 10YR 5/2 clay, extremely hard consistency (nearly “rock hard”); “shiny” appearance when cut with metal tool; some reddish-brown flecks and micro-mottling	Natural layer (alluvium), no cultural material – C-horizon

* An old utility excavation originating in Layer II was exposed at the south end of the trench; this old digging event extends down to a maximum of 115 cmbs and is filled with Layer II sediments.

Figure 66. Overview of Trench #7 at base of excavation, view northwest

Figure 67. Overview of Trench #7 at base of excavation, view southeast; red arrow indicates the clayey loam with soil structures overlying the clay (C-horizon) without pedogenic characteristics (yellow arrow)

Figure 68. Detail of a portion of northeast-facing profile at Trench #7, at west end of trench, view southwest

Figure 69. Detail of a portion of southwest-facing profile at Trench #7, at east end of trench, view northeast

Trench #8

Trench #8 exposed a very deep fill deposit containing late historic/early modern material, including a large amount of ferrous metal and other debris (e.g., metal cables, fragments of glass and ceramics) (see Figure 7). This fill deposit extends down to 140-155 cmbs, nearly all the way to the base of excavation. An abandoned ferrous metal pipe was observed at 105 cmbs.

Figure 70 and Table 10 document and depict the soil-stratigraphic layers exposed in excavation at Trench #8. Figure 71 is an overview photograph of Trench #8 at the base (completion) of excavation at a maximum depth of 180 cmbs. Bedrock consists of lithified coral shelf.

Figure 72 and Figure 73 show details of the soil-stratigraphy, which generally consists of the following sequence: a relatively deep (up to 25-cm thick) fill of modern sediments mixed with elements of topsoil (Layer Ia) and pockets of sand and gravel, atop a gravelly fill layer (Layer Ib); adjacent to these upper layers, there is a gravelly base course related to a utility just southwest of the trench. Older fill deposits--Layers Id and Ie—between approximately 25-35 cmbs (upper limits) and 140-155 cmbs (lower limits) contain abundant late historic/early modern debris. Below these fill deposits, resting upon the lithified coral shelf (bedrock), are a natural sandy clay (Layer II) and natural decomposing coral (Layer III).

Figure 74 shows several steel cables sticking out of the southeast-facing profile wall in the south end of the trench.

Figure 75 and Figure 76 show a variety of late historic/early modern metal, bottle glass and ceramic debris.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #8 consisted of late historic/early modern debris in Layers Id and Ie, including ferrous metal, bottle glass and ceramic fragments. Based on observations throughout the project area, this layer represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

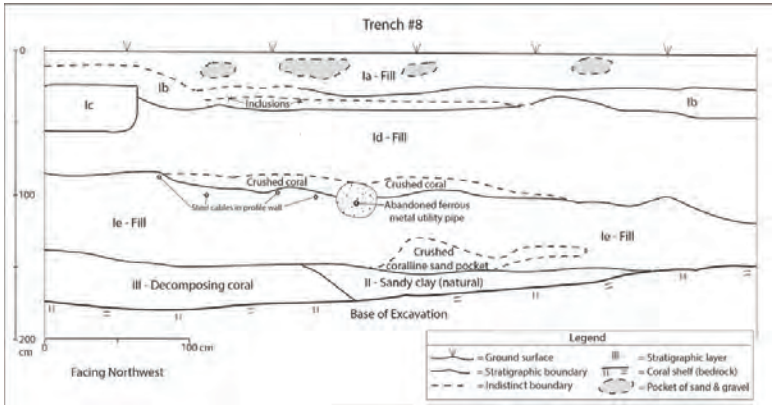

Figure 70. Stratigraphic profile of Test excavation (Trench) #8

Table 10. Summary of Soil-stratigraphic Units in Trench #8

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
Ia	0-10/25	10-25	Dark brown 7.5YR 3/3 gravelly silt; structureless; jumbled fill; includes grayish brown to dark grayish brown sandy loam mottling	Modern fill mixed with think topsoil
Ib	10/25-25/35	10-20	Very pale brown 10YR 8/2 extremely gravelly crushed coralline sand; very hard and compact consistency; w. grayish brown inclusions	Modern fill
Ic	25-55	30	Gray base course construction fill; medium- to large-sized gravel	Base course related to adjacent utility installation (late historic/early modern)
Id	25/35-87/117*	50-75	Dark brown 7.5YR 3/3 clay w. blocky structure; some saprolitic mottling; gravels mixed into clay	Fill layer w. late historic/early modern debris
Ie	87/117-140/155	50-65	Dark yellowish brown 10YR 3/6 sandy loam w. crumb structure; large pocket of crushed coralline sand at base of a portion of this layer	Fill layer w. late historic/early modern debris including bottle glass shards and ceramic sherds at 120 cmbs; old (abandoned) ferrous metal pipe and steel cables in upper layer
II	140/150-180	30-40	Dark brown 10YR 3/3 sandy clay w. light brown mottling	Natural layer (alluvium), no cultural material
III	150/155-175	5-20	Very pale brown 10YR 8/2 decomposing coral reef	Natural layer (decomposing coral shelf), no cultural material

* These dimensions do not take into account the intrusive utility construction layer (Ic) at the south end of the trench

Figure 74. View of south end of west side of Trench #8 showing metal cables in profile wall

Figure 75. Metal, glass and ceramic materials recovered from Trench #8

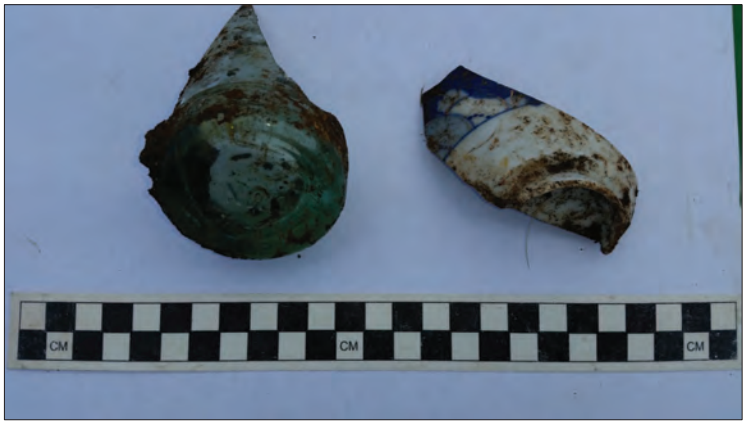

Figure 76. Base of glass bottle and ceramic cup recovered from Trench #8

Trench #9

Trench #9 exposed a relatively shallow deposit with a typical (for the project area) late historic/early modern fill layer also containing a butchered (with metal tools) cow bone (femur) (see Figure 7).

Figure 77 and Table 11 document and depict the soil-stratigraphic layers exposed in excavation at Trench #9. Figure 78 is an overview photograph of Trench #9 at the base (completion) of excavation at a maximum depth of 80 cmbs. Bedrock consists of lithified coral shelf.

Figure 79 to Figure 82 show details of the soil-stratigraphy, which generally consists of the following sequence: a typical (10-cm thick) topsoil (Layer I) over a late historic to early modern fill (Layer II, details below) atop a clay layer (Layer III) with a large pocket of crushed coral inclusions. This clay sits atop a thin layer (Layer IIIa) of decomposing lithified coral reef. A large cow bone, butchered using metal tools, was observed in the upper portion of Layer II. The bone was extremely leached from the surrounding clayey loam sediment, and was very friable and light in weight because of this chemical alteration. The upper portion of the underlying natural clay layer (Layer III) appears to have been at least partially altered by previous grading or bulldozing.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #9 consisted of late historic/early modern debris in Layers II, including ferrous metal, ceramic fragments and a butchered cow femur. Based on observations throughout the project area, this layer represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

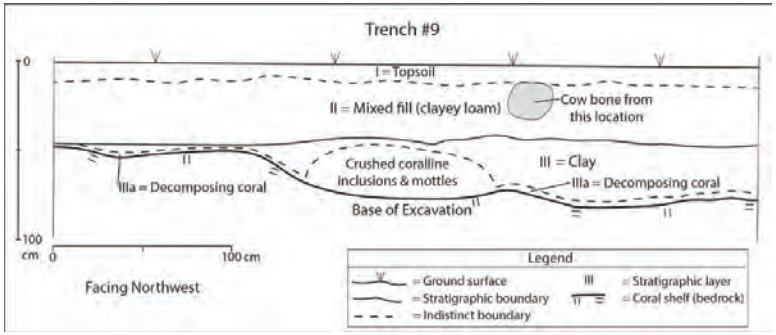

Figure 77. Stratigraphic profile of Test excavation (Trench) #9

Table 11. Summary of Soil-stratigraphic Units in Trench #9

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
I	0-10	10	Dark brown 10YR 3/2 loam w. soil peds & structure; loose consistency; few pebble-sized rocks	Modern trash
II	10-40/45	30-35	Very dark brown 10YR 2/2 clayey loam w. inclusions of crushed coral; platey structure; jumbled inclusions (no fining upward sequence); some pebble- and cobble-sized rocks	Fill layer w. late historic/early modern debris including small, non-diagnostic fragments of ferrous metal and ceramic shard; a portion of cow bone was recovered near top of Layer II
III	40/45-50/75	5-35	Dark brown 7.5YR 3/2 clay w. relatively abundant pebble- and cobble-sized rocks; blocky structure; moderately hard consistency	Natural layer, no cultural material; upper portion of layer may have been impacted by mechanical grading/bulldozing; there is a large pocket of crushed coralline inclusions in the middle of the layer
IIIa	50/75-52/77	2	Very pale brown 10YR 8/2 decomposing coral reef	Natural layer (decomposing coral shelf), no cultural material

Figure 78. Overview of Trench #9 at base of excavation, view northeast; note shallow coral shelf at base of excavation

Figure 80. Detail of a portion of the northwest-facing profile wall at Trench #9 at base of excavation, view southeast

Figure 81. Oblique view of a portion of southeast-facing profile wall at Trench #9, facing west; note shallow coral shelf in front of photo scale to left

Figure 82. Oblique view of a portion of northwest-facing profile wall at Trench #9, facing south

Trench #10

Trench #10 exposed possible pond or lo‘i kalo sediments (gray clay) just beneath a very thin late historic/early modern fill deposit (see Figure 7). The pond or lo‘i sediments, which were partially disturbed (truncated) by previous excavation originating from the late historic/early modern, rest atop a naturally-deposited clayey loam.

Figure 83 and Table 11 document and depict the soil-stratigraphic layers exposed in excavation at Trench #9. Figure 84 and Figure 85 are overview photographs of Trench #10 at the base (completion) of excavation at a maximum depth of 100 cmbs. Bedrock consists of undulating, decomposing basalt.

Figure 86 to Figure 89 show details of the soil-stratigraphy, which generally consists of the following sequence: a typical (10 to 15-cm thick) topsoil (Layer Ia) over a modern “blue rock” base course (Layer Ib) most likely related to an adjacent (modern) maintenance shed; these sit atop a very thin late historic to early modern fill (Layer II) that resembles the extensive fill deposit found throughout the project area (although it is usually much thicker); below this is a distinctive gray clay (Layer III) that appears to represent ponded sediments—perhaps lo‘i kalo. Beneath this gray clay is a clayey loam (Layer IV) with pedogenic properties that may be an agricultural soil.

The possible pond or lo‘i kalo deposit was documented in a total of five trenches (#s 6, 7, 10, 15 and 17). We discuss patterning in geomorphological strata in the Significance Assessments section following the Results.

As noted in the table and stratigraphic profile below, a boulder was found in the southeast-facing profile wall, at the interface of the bottom of Layer III (gray clay) and the top of Layer IV (clayey loam). We investigated whether this boulder could be part of a traditional rock structure—e.g., an agricultural terrace wall—by hand digging into the wall on both sides. We did not find any additional boulders that may have once been part of an old, subsurface rock structure.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #10 consisted of a very thin layer of late historic/early modern debris in Layers II, including ferrous metal, glass shards and ceramic fragments. Based on observations throughout the project area, this layer represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

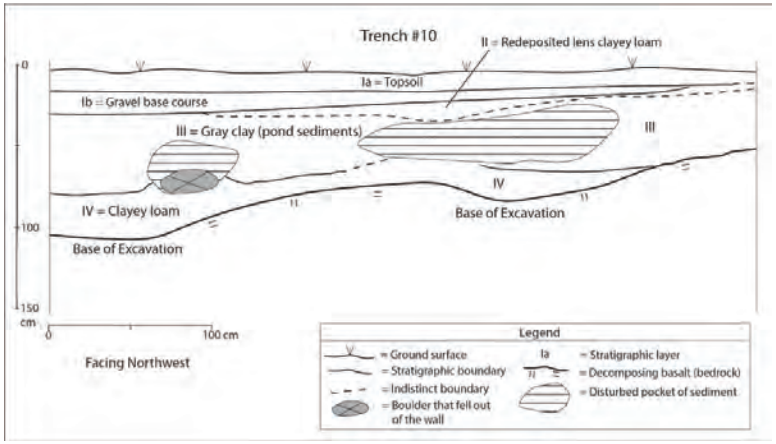

Figure 83. Stratigraphic profile of Test excavation (Trench) #10

Table 12. Summary of Soil-stratigraphic Units in Trench #10

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
Ia	0-10/15	10-15	Dark brown 10YR 3/2 sandy loam w. soil peds & structure; loose consistency; few pebble-sized rocks	Modern trash
Ib	10/15-15/25	5-10	Hard-packed “blue rock” gravel	Modern gravel base course, probably associated w. adjacent (modern) maintenance shed
II	12/25-13/27	5-10	Very dark brown 10YR 2/2 clayey loam w. inclusions of crushed coral; platey structure; jumbled inclusions (no fining upward sequence); some pebble- and cobble-sized rocks	Thin lens of late historic/early modern fill sediment
III	13/27-45/75	35-45	Gray 2.5YR 4/1 clay, sticky, very consolidated; no inclusions or mottling	Natural layer – possible pond or lo‘i kalo sediments, no cultural material; boulder at base of layer, at interface w. top of Layer IV
IV	45/75-65/100	5-25	Dark brown 10YR 3/3 clayey loam; crumbly structure w. soil peds; moderately loose consistency	Natural layer (possible agricultural soil), no cultural material; boulder at top of layer, at interface w. bottom of Layer III

Figure 84. Overview of Trench #10 at base of excavation, view northeast

Figure 89. Detail of a portion of the northwest-facing profile wall at Trench #10, base of excavation, near north end of trench, view southeast

Trench #11

The deposit in Trench #11 consists of modern fill sediments resting upon an old asphalt/concrete surface that probably dates from the late historic/early modern period (see Figure 7).

Figure 90 and Table 13 document and depict the soil-stratigraphic layers exposed in excavation at Trench #4. Figure 91 is an overview photograph of Trench #11 at the base (completion) of excavation at a maximum depth of 40 cmbs. Bedrock was not reached. The base of excavation was at an old asphalt/concrete surface.

Figure 92 and Figure 93 show details of the soil-stratigraphy, which generally consists of the following sequence: a relatively deep (20 to 25-cm thick) fill of gravelly sandy loam with modern debris (Layer Ia) atop a gravelly, crushed coralline sand layer (Layer Ib), atop of thin clayey loam (Layer Ic) resting directly on an old asphalt/concrete surface. A white PVC conduit (pipe) was observed in a very recent digging episode in the lower portion of Layer Ia (at 15 cmbs). The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. No historic-age materials were observed in this trench, except for the possible late historic/early modern asphalt/concrete surface at the base of excavation.

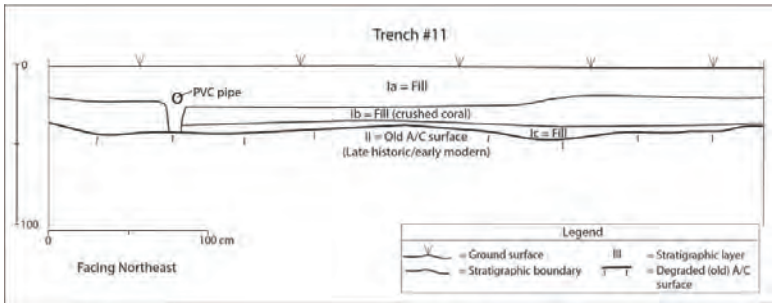

Figure 90. Stratigraphic profile of Test excavation (Trench) #11

Table 13. Summary of Soil-stratigraphic Units in Trench #11

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
Ia	0-20/25	20-25	Dark brown 10YR 3/3 sandy loam w. occasional gravel, no soil structure	Modern trash
Ib	20/25-35	10-15	Dark gray 10YR 7/2 gravelly crushed coralline sand, very hard-packed consistency; w. very pale brown 10YR 8/2 lens in upper NW portion of layer	Modern gravel base course
Ic	35-40	5	Very dark grayish brown 10YR 3/2 clayey loam; jumbled structure; some pebble- and cobble-sized rocks	Modern fill
II	40-Unknown	Unknown	Asphalt/concrete surface	Late historic/early modern surface

Figure 91. Overview of Trench #11 at base of excavation, view northwest

Figure 92. Detail of a portion of the northeast-facing profile wall at Trench #11 at base of excavation, view southwest

Figure 93. Detail of a portion of the southwest-facing profile wall at Trench #11 at base of excavation, view northeast

Trench #12

Trench #12 exposed a possible anthropogenic (agricultural) soil below an old (late historic/early modern) asphalt/concrete surface (see Figure 7).

Figure 94 and Table 14 document and depict the soil-stratigraphic layers exposed in excavation at Trench #12. Figure 95 is an overview photograph of Trench #12 at the base (completion) of excavation at a maximum depth of 140 cmbs. Bedrock consists of decomposing basalt.

Figure 96 and Figure 97 show details of the soil-stratigraphy, which generally consists of the following sequence: a relatively deep (25-cm thick) topsoil (Layer I) atop a late historic/early modern asphalt/concrete surface (Layer Ib) with base course (Layer Ic), over an organic-rich loam (Layer II) that appears to represent a non-irrigated (non-pond/lo‘i) soil, atop a clayey loam (Layer III) C-horizon.

We exposed a large piece of ferrous-metal wire in the upper portion of Layer II (Figure 98). This metal, which is not buried too deep in the loamy soil, was the only evidence of cultural material in this probable agricultural soil. The loam deposit (Layer II) is similar to one (designated Layer III) exposed in Trench #2, located just northwest of Trench #12.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #12 consisted of the old asphalt/concrete surface likely dating from the late historic/early modern period, as well as the ferrous metal in the top of Layer II. It is interesting that Trench #12 is one of the only excavations in the project area to lack the near-ubiquitous late historic/early modern layer—which always contains a high amount of crushed coral inclusions (in addition to small bits of metal, glass and ceramics). We discuss this evidence in more detail after the results section (see Significance Assessments).

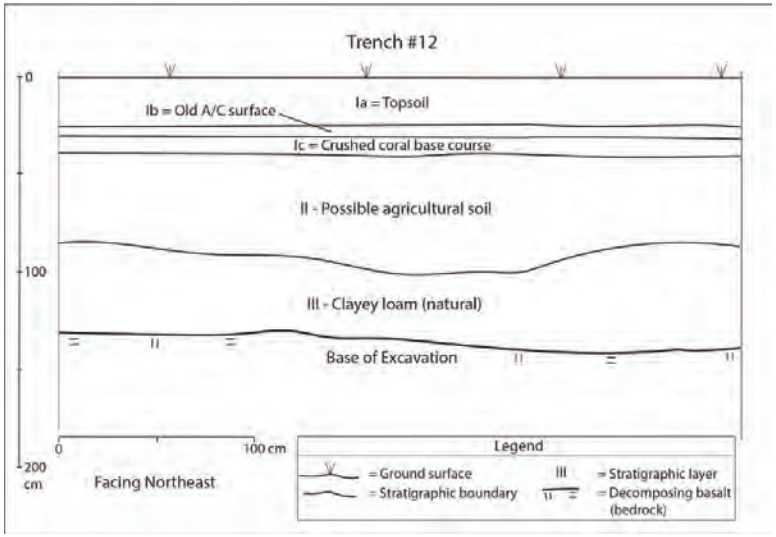

Figure 94. Stratigraphic profile of Test excavation (Trench) #12

Table 14. Summary of Soil-stratigraphic Units in Trench #12

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
Ia	0-25	25	Very dark grayish brown 10YR 3/2 loam w. soil peds & structure; loose consistency; abundant fine-large roots; few pebble-sized rocks	Modern trash
Ib	25-30	5	Old asphalt/concrete surface	Probably late historic/early modern in age
Ic	30-40	10	Crushed coralline sand base courses for old asphalt/concrete layer	Probably late historic/early modern in age
II	40-85/100	45-60	Very dark brown 10YR 2/2 loam; crumbly to platey structure w. soil peds; moderately loose consistency	Natural layer (possible agricultural soil), no cultural material; organic-rich loam; ferrous metal wire sticking out of SE profile wall in upper portion of layer
III	85/100-130/140	35-55	Very dark brown 7.5YR 2.5/3 clayey loam; extremely hard (compact) consistency; very large blocky structure	Natural layer (alluvium), no cultural material – C-horizon

Figure 95. Overview of Trench #12 at base of excavation, view northwest

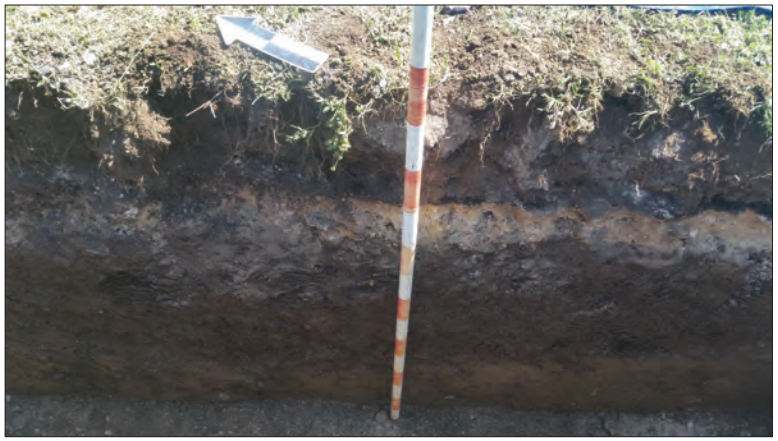

Figure 96. Detail of a portion of the southwest-facing profile wall at Trench #12 at base of excavation, view northeast

Figure 97. Detail of a portion of the northeast -facing profile wall at Trench #12 at base of excavation, view southwest; note old asphalt surface about 15 cmbs (above light-colored base course)

Figure 98. Detail of east end of Trench #12 showing ferrous metal rod sticking out of the upper portion of Layer II (note, this blurry photo is the best one we have of this important observation)

Trench #13

Trench #13 exposed a late historic/early modern fill layer with a very well-defined and -preserved basal concentration of debris (including fragments of old-style hollow tile and a lens of [out of context] asphalt-like substance) at 60-75 cmbs (see Figure 7).

Figure 99 and Table 15 document and depict the soil-stratigraphic layers exposed in excavation at Trench #13. Figure 100 is an overview photograph of Trench #13 at the base (completion) of excavation at a maximum depth of 210 cmbs. Bedrock consists of decomposing basalt.

During excavation, starting at approximately 13 cmbs, we observed a boulder near the east end of the trench (approximately 1.7 m west of the east end of the trench). Because we were uncertain as to whether this boulder was part of a buried rock structure, such as a rock wall or terrace, we carefully excavated around it and documented its eventual removal at its base (approximately 45 cmbs). In the final analysis, we did not uncover any other rocks on either the north or south side of this boulder, nor did we find any underneath it. Figure 101 and Figure 102 show the boulder in Trench #13 as it was being excavated.

Figure 103 and Figure 104 show details of the soil-stratigraphy, which generally consists of the following sequence: a typical (10 to 15-cm thick) topsoil (Layer I) atop an older topsoil (Layer II); these rest atop a late historic/early modern fill deposit (Layer II) over a relatively deep (140-150 cm thick) clayey loam C-horizon (Layer III).

Figure 105 shows a detailed view of the well-developed and –preserved debris layer at base of the Layer II sediments. This debris layer includes abundant, fragmentary hollow tile and an asphalt-like substance (that does not represent an old land surface, but rather, a dumping/filling event).

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #13 consisted of the late historic/early modern fill. Based on observations throughout the project area, this layer represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

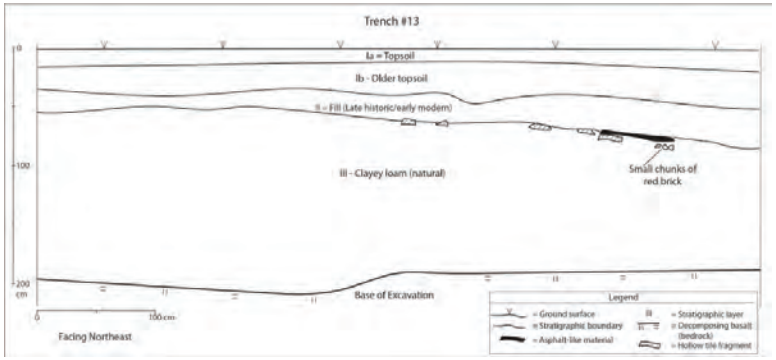

Figure 99. Stratigraphic profile of Test excavation (Trench) #13

Table 15. Summary of Soil-stratigraphic Units in Trench #13

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
Ia	0-10/15	10-15	Dark brown 10YR 3/3 sandy loam w. soil peds & structure; loose consistency	Modern trash
Ib	10/15-35/45	20-30	Dark yellowish brown 10YR 3/4 sandy loam; relatively hard (compact) consistency	Older top soil
II	35/45-50/85	10-30	Very dark grayish brown 2.5YR 3/2 clayey loam w. relatively loose consistency; jumbled structure w. no sorting	Fill layer w. late historic/early modern debris including small, non-diagnostic fragments of ferrous metal, glass, bricks, hollow tile and ceramics; also a lens of old (out of context) asphalt-like material near SE end of trench; very well-developed and –preserved debris layer at base of this sedimentary layer
III	50/85-190/210	140-150	Brown 10YR 4/3 clayey loam; hard (compact) consistency; very well-developed and widespread mottling of multiple colors (yellow-brown, orang-brown, red-brown, some black and gray, as well); mottling decreases in density with depth	Natural layer (alluvium), no cultural material – C-horizon

Figure 105. Detail of asphalt-like material (arrow) exposed in profile wall at the base of Layer II, view northeast

Trench #14

Trench #14 exposed a relatively deep (85 to 90-cm thick) late historic/early modern fill layer with an abandoned ferrous-metal pipe near its base, overlying a natural clayey loam (below 85-100 cmbs) (see Figure 7).

Figure 106 and Table 16 document and depict the soil-stratigraphic layers exposed in excavation at Trench #14. Figure 106 is an overview photograph of Trench #14 at the base (completion) of excavation at a maximum depth of 135 cmbs. Bedrock consists of decomposing basalt.

Figure 108 and Figure 109 show details of the soil-stratigraphy, which generally consists of the following sequence: a typical (10 to 15-cm thick) topsoil (Layer I) atop a deep (down to 100 cmbs) late historic/early modern fill deposit (Layer II) over a clayey loam C-horizon (Layer III).

Figure 110 and Figure 111 show ferrous metal, red ceramic drainage pipe, glass and ceramics recovered in excavation from Layer II. As depicted in the stratigraphic profile, there was a concentration of debris in the lowermost portion of the cultural layer.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #14 consisted of the late historic/early modern fill. Based on observations throughout the project area, this layer represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

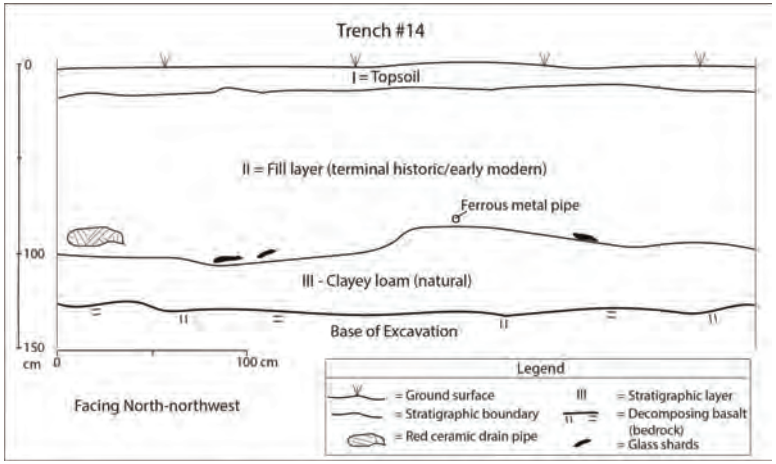

Figure 106. Stratigraphic profile of Test excavation (Trench) #14

Table 16. Summary of Soil-stratigraphic Units in Trench #14

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
I	0-10/15	10-15	Dark brown 10YR 3/3 sandy silt w. soil peds & structure; very loose consistency; very few rocks	Modern trash, but mostly free of debris
II	15/20-85/105	70-85	Very dark grayish brown 2.5YR 3/2 clayey loam w. relatively loose consistency; jumbled structure w. no sorting	Fill layer w. late historic/early modern debris including large and small pieces of ferrous metal, glass, red ceramic drainage pipe, glass shards, blue ware ceramics; material concentrated at base of layer
III	85/105-130/135	25-50	Very dark brown 2.5YR 3/2 clay; very hard (compact) consistency; some micro-inclusions of shell and lithified coral	Natural layer (alluvium), no cultural material – C-horizon

Figure 110. Late historic artifacts from Layer II at Trench #14

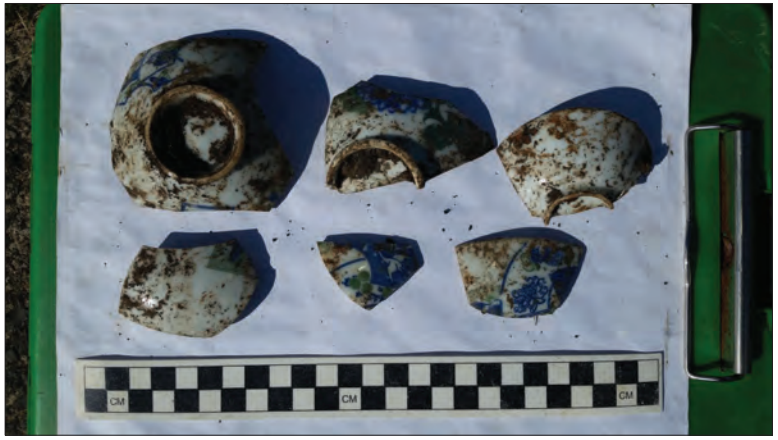

Figure 111. Close up of ceramics from Layer II at Trench #14

Trench #15

Trench #15 exposed possible pond or lo‘i kalo sediments (gray clay, Layer III) just beneath a late historic/early modern fill deposit (Layer II). The pond or lo‘i sediment layer has been partially disturbed (truncated) by previous digging activities (see Figure 7).

Figure 112 and Table 17 document and depict the soil-stratigraphic layers exposed in excavation at Trench #15. Figure 113 is an overview photograph of Trench #15 at the base (completion) of excavation at a maximum depth of 128 cmbs. Bedrock consists of undulating, decomposing basalt.

Figure 114 to Figure 117 show details of the soil-stratigraphy, which generally consists of the following sequence: a 30 to 40-cm thick series of three thin layers (topsoil, Layer Ia; an older topsoil, Layer Ib; and a modern fill, Layer Ic) atop a late historic/early modern fill deposit (Layer II) that has been disturbed (truncated) at its south end; atop a distinctive gray clay (Layer III) that appears to represent ponded sediments—perhaps lo‘i kalo, over a natural, basal clay layer (Layers IV).

The possible pond or lo‘i kalo deposit was documented in a total of five trenches (#s 6, 7, 10, 15 and 17). We discuss patterning in geomorphological strata in the Significance Assessments section following the Results.

Figure 118 show fragments of blue ware ceramics recovered from the base of Layer II.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #15 consisted of the late historic/early modern fill (Layer II). Based on observations throughout the project area, this layer represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

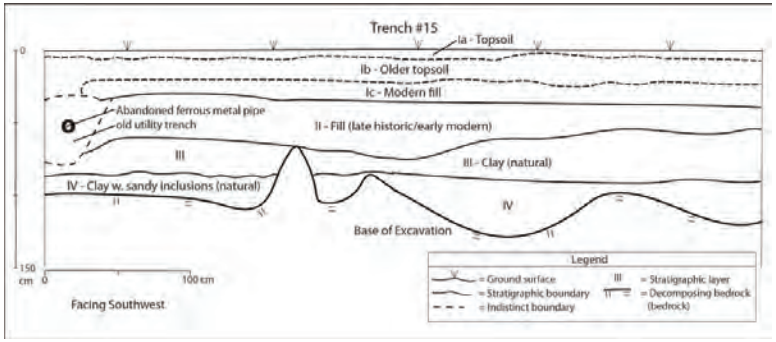

Figure 112. Stratigraphic profile of Test excavation (Trench) #15

Table 17. Summary of Soil-stratigraphic Units in Trench #15

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
Ia	0-5/10	5-10	Dark brown 10YR 3/3 sandy silt w. soil peds & structure; very loose consistency; very few rocks	Modern trash, but mostly free of debris
Ib	5/10-25	15-20	Dark brown 10YR 3/3 clayey loam; abundant very fine roots	Older topsoil, modern trash
Ic	25-35/40	10-15	Very dark brown 10YR 2/2 clayey loam	Fill with modern trash
II	35/40-55/75	20-50	Very dark grayish brown 10YR 3/2 clayey loam w. relatively loose consistency; jumbled structure w. no sorting; very gravelly w. abundant crushed coral	Fill layer w. late historic/early modern debris including small pieces of ferrous metal and glass
III	55/75-85/90	15-45	Dark gray 10YR 4/1 clay w. blocky structure; abundant micro-inclusions, rootlets, micro-mottling, and flecks of micro-charcoal	Possible pond or lo‘i kalo sediments
IV	85/90-100/128	15-45	Dark yellowish brown 10YR 4/4 clay w. sandy inclusions; blocky/crumbly structure	Natural layer, no cultural materials

Figure 117. Oblique view of a portion of southwest-facing profile wall at Trench #15, facing northwest

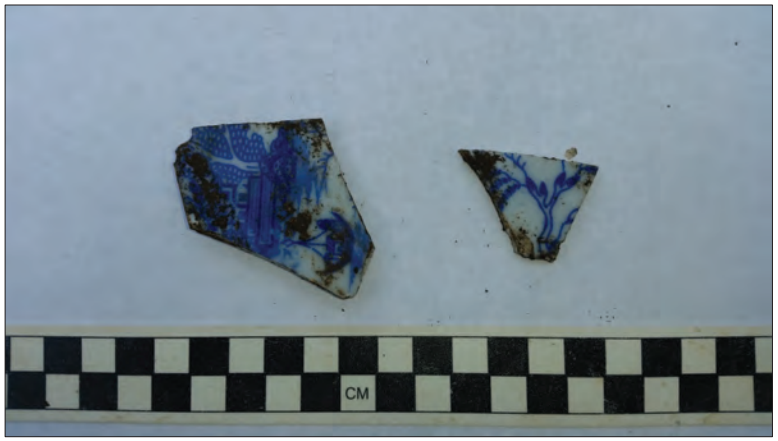

Figure 118. Ceramics recovered in base of Layer II at Trench #15

Trench #16

Trench #16 was dominated by a series of relatively deep fill deposits (Layers II & III) containing a massive amount of rock, broken up concrete, and bricks and mortar, down to 85-110 cmbs (see Figure 7). The base of excavation consists of a natural clay (Layer IV) into which a previous utility excavation was dug. The massive filled-in pit comprising most of this trench has been designated Feature 2 of Site 8033.

Figure 119 and Table 18 document and depict the soil-stratigraphic layers exposed in excavation at Trench #16. Figure 120 is an overview photograph of Trench #16 at the base (completion) of excavation at a maximum depth of 135 cmbs. Bedrock consists of decomposing basalt.

Figure 121 to Figure 124 show details of the soil-stratigraphy, which generally consists of the following sequence: a typical (10 to 15-cm thick) topsoil (Layer I) atop a late historic/early modern fill deposit (Layer II) that varies from very thin (10 cm) at the south end of the trench to thicker (50-60 cm) in the north end; beneath this, another late historic/early modern fill deposit (Layer III) contains massive amounts of rock, concrete chunks, bricks and mortar, atop the only natural layer in the trench (Layer IV, a dark gray clay).

Figure 125 shows some representative materials—including ferrous metal, a spark plug from a car or truck, fragments of glass and ceramics, and chunks of concrete slabs--recovered from Layers II and III.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #16 consisted of the late historic/early modern fill (Layers II & III). Based on observations throughout the project area, this layer represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

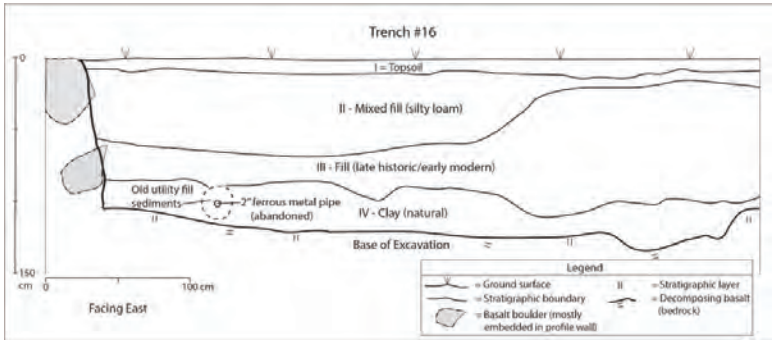

Figure 119. Stratigraphic profile of Test excavation (Trench) #16

Table 18. Summary of Soil-stratigraphic Units in Trench #16

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
I	0-10/15	10-15	Dark brown 7.5YR 3/3 sandy silt w. soil peds & structure; loose consistency; pebble- and cobble-sized rocks common	Modern trash
II	10-15/70	5-60	Dark brown 10YR 3/3 clayey loam w. moderately loose consistency; crumb structure w. no size sorting; inclusions of crushed coral; rocks and rubble abundant	Mixed fill layer w. modern and late historic/early modern debris including large and small pieces of ferrous metal, glass shards, blue ware ceramics
III	15/70-80/110	15-85	Brown 7.5YR 4/3 very gravelly sandy loam; abundant cobbles and small boulders; mottling of many colors throughout matrix	Fill layer w. late historic/early modern debris including large and small pieces of ferrous metal, glass shards, blue ware ceramics
IV	80/110-105/135	15-35	Dark gray 10YR 4/1 clay	Natural layer (alluvium), no cultural material – C-horizon; old utility trench with ferrous metal pipe dug into this layer from above

Figure 124. Oblique view of east-facing profile wall (south half) of Trench #16, view southwest

Figure 125. Various late historic/early modern artifacts recovered in Layer II and/or Layer III at Trench #16

Trench #17

Trench #17 exposed possible pond or lo‘i kalo sediments (gray clay, Layer III) just beneath a typical (for the current project area) late historic/early modern fill deposit (Layer II) (see Figure 7). Several animal bones, including a horse metapodial (foot bone), were recovered from the gray clay layer.

Figure 126 and Table 19 document and depict the soil-stratigraphic layers exposed in excavation at Trench #17. Figure 127 and Figure 128 are overview photographs of Trench #17 at the base (completion) of excavation at a maximum depth of 210 cmbs. Bedrock consists of decomposing basalt.

Figure 129 and Figure 130 show details of the soil-stratigraphy, which generally consists of the following sequence: a relatively deep (20 to 30-cm thick) topsoil (Layer Ia) atop an older topsoil (Layer Ib) atop a late historic/early modern fill deposit (Layer II) with abundant cobble- and small boulder-size rocks; beneath this, a distinctive gray clay (Layer III) that appears to represent ponded sediments—perhaps lo‘i kalo, sits atop a natural, basal clay layer (Layers IV).

The possible pond or lo‘i kalo deposit was documented in a total of five trenches (#s 6, 7, 10, 15 and 17). We discuss patterning in geomorphological strata in the Significance Assessments section following the Results.

Figure 131 shows some representative materials—including ferrous metal, fragments of bottle glass and ceramics—from Layer II; and some horse bones from Layer III.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #17 consisted of the late historic/early modern fill (Layer II) and some horse (foot) bones tossed in the pond or lo‘i kalo sediments. Based on observations throughout the project area, Layer II clearly represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

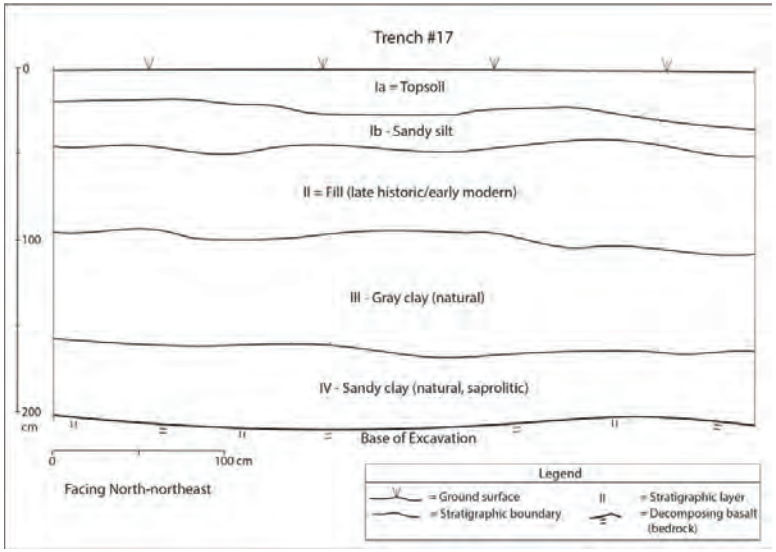

Figure 126. Stratigraphic profile of Test excavation (Trench) #17

Table 19. Summary of Soil-stratigraphic Units in Trench #17

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
Ia	0-20/30	20-30	Dark brown 7.5YR 3/3 clayey loam w. soil peds & structure; moderately loose consistency; abundant micro-inclusions of shell and lithified coral; abundant rootlets	Modern trash
Ib	20/30-45/50	15-25	Dark red 2.5YR 3/6 sandy silt; loose consistency; abundant pebble-size rocks (angular gravels); abundant rootlets	Modern trash
II	45/50-95/110	50-65	Very dark grayish brown 10YR 3/2 clayey loam; loose consistency; structureless; poorly sorted; abundant cobble- and small boulder-size rocks	Fill layer w. late historic/early modern debris including ferrous metal, glass, and blue ware ceramics
III	95/110-155/165	55-75	Dark gray 10YR 4/1 clay w. blocky structure; abundant micro-inclusions, rootlets, micro-mottling, and flecks of micro-charcoal	Possible pond or lo‘i kalo sediments
IV	155/165-205/210	35-50	Light olive brown 2.5YR 5/4 sandy clay; moderately consolidated	Natural layer (alluvium), no cultural material – C-horizon

Figure 131. Recovered ferrous metal materials, glass fragments and animal bones, including portions of a horse metapodial (mostly complete gray-stained bone to the right)

Trench #18

Trench #18 exposed a series of natural layers including a silty alluvium (Layer III) atop a saprolitic clayey loam (Layer IV) atop sterile clay (Layer V, C-horizon), all beneath a late historic/early modern fill deposit (Layer II) (see Figure 7).

Figure 132 and Table 20 document and depict the soil-stratigraphic layers exposed in excavation at Trench #18. Figure 133 is an overview photograph of Trench #18 at the base (completion) of excavation at a maximum depth of 230 cmbs. Bedrock consists of lithified coral shelf.

Figure 134 and Figure 135 show details of the soil-stratigraphy, which generally consists of the following sequence: a typical (10 to 15-cm thick) topsoil (Layer I) atop a late historic/early modern fill deposit (Layer II); beneath this, a series of natural, clayey loams (Layers III & IV) and basal clay (Layer V), the lowermost 10-15 cm are darkened compared with the rest of this layer.

A relatively thin but conspicuous band of lithified coral fragments is located at the interface of the basal clay (Layer V) and the clayey loam that overlies it (Layer IV).

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #18 consisted of a relatively small amount of typical (for the current project area) late historic/early modern fill (Layer II), including small pieces of non-diagnostic ferrous metal, glass and ceramics. Based on observations throughout the project area, Layer II clearly represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

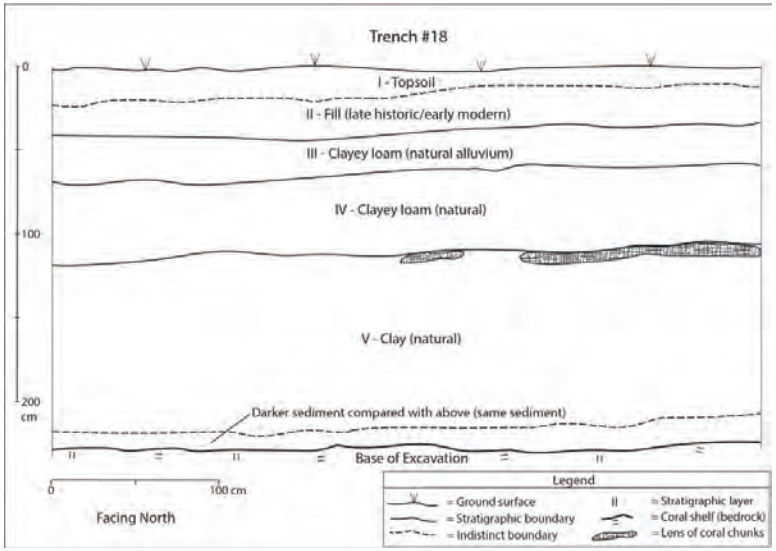

Figure 132. Stratigraphic profile of Test excavation (Trench) #18

Table 20. Summary of Soil-stratigraphic Units in Trench #18

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
Ia	0-10/20	10-20	Dark brown 7.5YR 3/3 sandy loam w. soil peds & structure; loose consistency	Modern trash
II	10/20-35/40	15-20	Dark yellowish brown 10YR 3/4 sandy loam; moderately hard consistency; occasional pebble- and cobble-size rocks	Fill layer w. late historic/early modern debris including small amounts of ferrous metal, glass, and blue ware ceramics
III	35/40-60/67	20-27	Dark reddish brown 5YR 3/3 clayey loam; moderately hard consistency; structureless	Natural layer (alluvium), no cultural material
IV	60/67-110/115	40-55	Dark reddish brown 5YR 3/3 clayey loam w. abundant saprolitic staining and decomposing nodules of basalt	Natural layer, no cultural material; abundant saprolitic mottling/staining
V	110/115-230	115-120	Dark reddish brown 5YR 3/3 clay	Natural layer, no cultural material – C-horizon

Figure 133. Overview of Trench #18 at base of excavation, view east-southeast

Figure 134. Detail view looking down into east end of Trench #18 at south-facing profile, view north

Figure 135. Detail of a portion of the north-facing profile wall at Trench #18 at base of excavation, view south

Trench #19

Trench #19 exposed a series of fill deposits down to the coral shelf (bedrock). A heavy-duty, ferrous metal utility pipe crosses the trench at approximately 75 cmbs, and cultural material recovered includes many large metal objects including machine and/or vehicle parts (see Figure 7). The massive filled-in pit comprising most of this trench has been designated Feature 3 of Site 8033.

Figure 136 and Table 21 document and depict the soil-stratigraphic layers exposed in excavation at Trench #19. Figure 137 is an overview photograph of Trench #19 at the base (completion) of excavation at a maximum depth of 150 cmbs. Bedrock consists of lithified coral shelf.

Figure 138 and Figure 139 show details of the soil-stratigraphy, which generally consists of the following sequence: a sandy silt topsoil mixed with modern debris (Layer I) atop three late historic/early modern fill deposits (Layers IIa, IIb & IIc) containing abundant large ferrous-metal objects, cobble- and small boulder-sized rocks, and other debris (e.g., chunks of concrete). These fill deposits extent all the way to the coral shelf (bedrock).

Figure 140 and Figure 141 show representative cultural materials from the Trench #19 late historic/early modern fill layers.

Trench #19 appears to document more than just a grading/bulldozing episode preceding the construction of the current Mayor Wright Homes in the middle 1950s. This trench appears to also represent a deeper filling event, perhaps a large opening, void or sinkhole in the lithified coral.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #19 consisted of abundant large ferrous-metal objects and bottle glass. Based on observations throughout the project area, Layer II, which we have sub-divided into three different depositional units (a, b and c) clearly represents a widespread bulldozing event and also filling in of a deep void or sinkhole we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

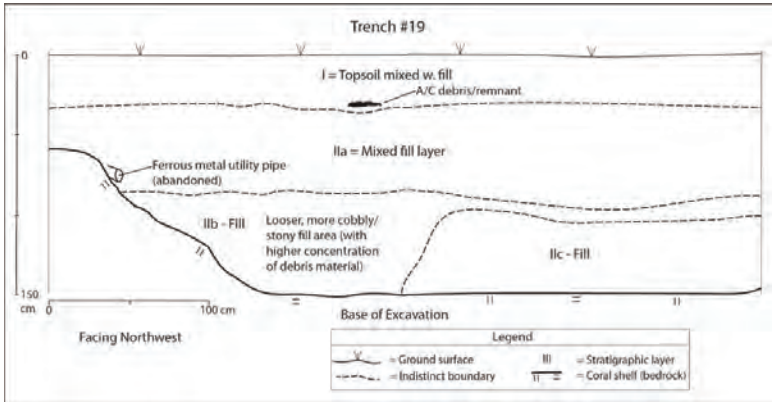

Figure 136. Stratigraphic profile of Test excavation (Trench) #19

Table 21. Summary of Soil-stratigraphic Units in Trench #19

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
Ia	0-30	30	Dark brown 10YR 3/3 sandy silt; very loose consistency; abundant modern debris	Modern trash
IIa	30-85/100	55-70	Dark brown 7.5YR 3/4 silty loam; loose consistency; abundant pebble-size rocks (angular gravels); abundant rootlets	Fill, some modern and late historic/early modern debris, including large ferrous-metal objects, bottle glass
IIb	85/100-100/150	10-65	Dark grayish brown 10YR 4/2 gravelly/rocky silty loam; loose consistency; structureless; poorly sorted; abundant cobble- and small boulder-size rocks	Fill, abundant late historic/early modern debris, including large ferrous-metal objects, bottle glass
IIc	100/110-150	40-50	Brown 7.5YR 4/4 gravelly clay loam; poorly-sorted	Fill, rocks and rubble; this layer appears to have been cut into/disturbed during by deposition of Layer IIb

Figure 137. Overview of Trench #19 at base of excavation, view north

Figure 140. Ferrous-metal items, glass fragments and rubber-wrapped wire (lower right) from Trench #19 (Layer IIa and/or Layer IIb)

Figure 141. Ferrous-metal object from base of Layer IIa in Trench #19

Trench #20

Trench #20 exposed a deep deposit consisting entirely of fill extending down to the water table (see Figure 7). These fill deposits, which included a more typical (for the current project area) late historic/early modern layer (Layer II), just below the topsoil, containing abundant small pieces of degraded ferrous-metal, glass shards and ceramic sherds, also included a massive (more than 160-cm thick), poorly-sorted and jumbled layer containing a large amount of old paving stones, concrete blocks, bricks and mortar, ferrous-metal car parts, batteries, and many glass bottles. The massive filled-in pit comprising most of this trench has been designated Feature 4 of Site 8033.

Figure 142 and Table 22 document and depict the soil-stratigraphic layers exposed in excavation at Trench #20. Figure 143 is an overview photograph of Trench #20 at the base (completion) of excavation at a maximum depth of 220 cmbs. Bedrock was not reached as the water table was encountered at 220 cmbs. At this point, due in particular to the loose, rocky fill deposit that dominated most of this excavation, the trench was extremely unstable and dangerous to dig more into the water table sediments.

Figure 144 and Figure 145 show details of the soil-stratigraphy, which generally consists of the following sequence: a silty loam topsoil with abundant inclusions of small bits of shell and red brick fragments (Layer I) atop a typical (for the current project area) late historic/early modern fill with relatively small amounts of debris (Layer II) atop a massive fill layer (Layer III) with abundant material characterized in the first paragraph if this narrative.

Figure 146 shows the back dirt pile from Trench #20, which yielded a very large number of paving stones, blocks, bricks and other rocky debris.

Figure 147 and Figure 148 show representative cultural materials from the Trench #20.

Trench #20 appears to document more than just a grading/bulldozing episode preceding the construction of the current Mayor Wright Homes in the middle 1950s. This trench appears to also represent a deeper filling event, perhaps a large opening, void or sinkhole in the lithified coral.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #20 consisted of typical (for the current project area) late historic/early modern small pieces of ferrous metal, glass and ceramics (Layer II); and a massive amount of rocks, blocks, bricks, ferrous metal and glass bottles (Layer III). Based on observations throughout the project area, Layer II clearly represents a widespread bulldozing event, while Layer III derives from a major filling in of a deep void or sinkhole we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

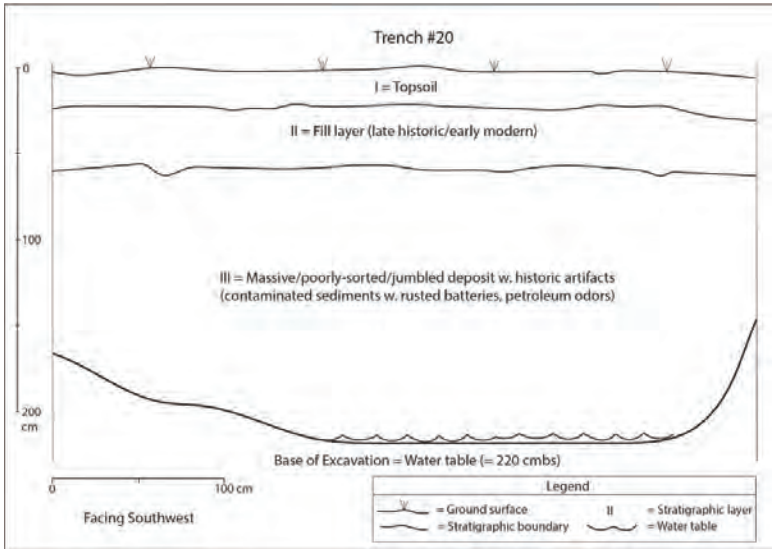

Figure 142. Stratigraphic profile of Test excavation (Trench) #20

Table 22. Summary of Soil-stratigraphic Units in Trench #20

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
I	0-20/25	20-25	Brown 10YR 4/3 silty loam w. soil peds & structure; moderately loose consistency; abundant inclusions of small bits of shell and red brick fragments	Modern trash
II	20/25-55/60	30-40	Very dark grayish brown 10YR 3/2 clayey loam; loose consistency; structureless; poorly sorted; abundant cobble- and small boulder-size rocks	Fill layer w. late historic/early modern debris including ferrous metal, glass, and blue ware ceramics
III	55/60-220	160-165	Dark olive brown 2.5YR 3/3 clayey loam, poorly-sorted, jumbled structure, full of late historic/early modern debris	Fill layer w. abundant paving stones, concrete blocks, bricks and mortar, ferrous-metal car parts, batteries, and many glass bottles

Figure 147. Overview of metal and glass material recovered at Trench #20; note, several whole glass bottles and other materials were collected and described (see Laboratory Results)

Figure 148. Detail of paving stones and bricks recovered from Trench #20

Trench #21

Trench #21 exposed a late historic/early modern fill deposit (Layer II) capping a pair of very large (approximately 3-ft diameter) drainage pipes that appear to be a relatively old (probably late historic period) construction style. Laterally equivalent with the drainage pipes is a disturbed layer (Layer IIa), which contains ferrous metal and red brick, and extends down to 135 cmbs (see Figure 7). A basal greenish gray clay (gley) layer (Layer III) appears to represent ponded or still (quiet) water sediments, but is unlikely to be a lo‘i kalo deposit due to its relative depth (top is 125-135 cmbs) compared with other examples in the project area.

Figure 149 and Table 23 document and depict the soil-stratigraphic layers exposed in excavation at Trench #21. Figure 150 and Figure 151 are overview photographs of Trench #21 at the base (completion) of excavation at a maximum depth of 225 cmbs. Bedrock was not reached as the water table was encountered at 225 cmbs. Due to the discovery of two, very large drainage structures in the west end of the trench, and uncertainty as to whether they were still servicing the housing complex, only the north half of the trench was completed down to the water table. We were reluctant, as well, to undermine these structures for fear they might break.

Figure 152 and Figure 153 show details of the soil-stratigraphy, which generally consists of the following sequence: a silty loam topsoil with abundant inclusions of small bits of shell and red brick fragments (Layer I) atop a late historic/early modern fill with relatively small amounts of debris (Layer II) atop a disturbed layer (Layer IIa) that contains a mix of sediments from both the overlying and underlying layers—and appears to be related to the installation of the very large drainage structures; the main basal unit (Layer III) is an extremely smooth, pure greenish gray clay with a “creamy” consistency. Within this clay layer, near its base, is a small pocket of cinder (Layer IV). At the water table, another thin layer (Layer V) consists of coarse sand and cinder mixed together.

Trench #21 appears to document more than just a grading/bulldozing episode preceding the construction of the current Mayor Wright Homes in the middle 1950s. This trench also appears to document a deeper filling event associated with the installation of the (still intact) drainage structures under Layer II.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #21 consisted of typical (for the current project area) late historic/early modern small pieces of ferrous metal, glass and ceramics (Layer II); and the drainage structures and laterally-equivalent fill (Layer IIa). Based on observations throughout the project area, Layer II clearly represents a widespread bulldozing event. Layer IIa is probably penecontemporaneous with the Layer II grading. We discuss this evidence in more detail after the results section (see Significance Assessments).

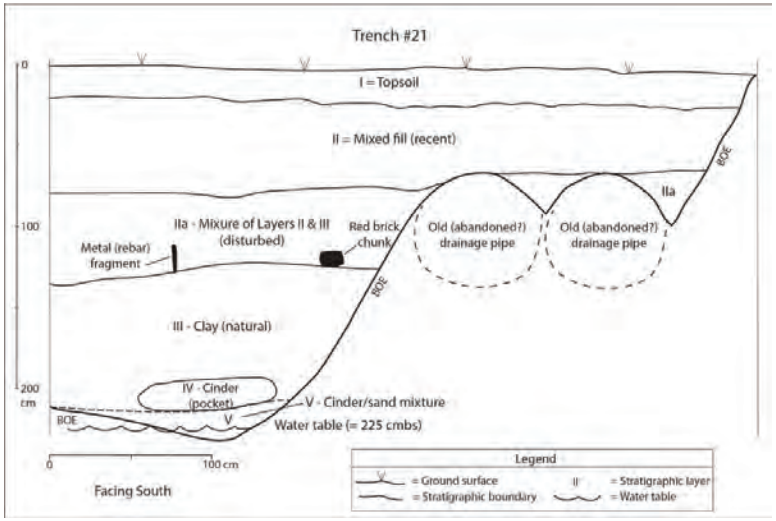

Figure 149. Stratigraphic profile of Test excavation (Trench) #21

Table 23. Summary of Soil-stratigraphic Units in Trench #21

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
I	0-20	20	Brown 10YR 4/3 silty loam w. soil peds & structure; moderately loose consistency; abundant inclusions of small pieces of shell & red brick	Modern trash
II	20-60/80	40-60	Reddish brown 5YR 4/4 silty clay; moderately loose consistency; crumbly structure; abundant inclusions of crushed coral	Fill layer w. late historic/early modern debris including ferrous metal, glass, and blue ware ceramics
IIa	60/80-125/135	42-55	Mixture of Layers II & III	Layer of disturbance, digging/ filling, associated w. adjacent drainage infrastructure; metal bar and red brick in base of layer
III	125/135-210/215	80-85	Greenish gray [Gley I 5/10Y (5/1)] clay; very smooth, very "creamy" consistency; pure clay with no inclusions	Possible pond sediments – unclear if this may be lo'i kalo sediments
IV	195-210	15	Multi-colored cinder; loose, structureless lenses and pockets	Natural layer, no cultural material; cinder occurs as pocket within Layer III
V	210-225	15	Mixture of coarse sand and cinder; loose consistency	Thin layer of natural coarse sand and cinder at base of Layer III

Figure 150. Overview of Trench #21 at base of excavation, view northwest; note, arrows at far end indicate location (top surfaces) of subsurface drainage pipes

Figure 151. Overview of Trench #21 at base of excavation, view southeast; note, arrows at near end indicate location (top surfaces) of subsurface drainage pipes

Figure 152. Portion of Trench #21 at base of excavation, view east

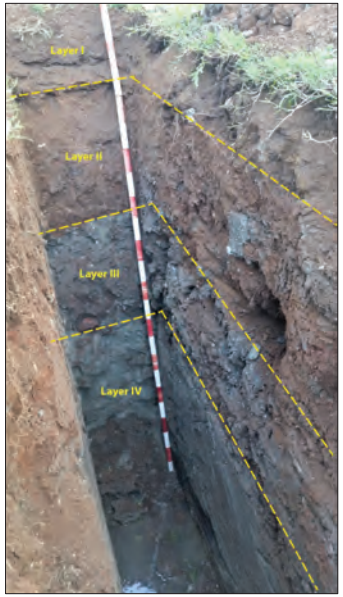

Figure 153. Portion of Trench #2, base of excavation, view southeast; layers and approximate boundaries are annotated; note, smearing of sediments by backhoe bucket can be seen in a few places

Trench #22

Trench #22 exposed a typical (for the current project area) late historic/early modern deposit (Layer II) over another fill containing an abandoned ferrous-metal pipe; the lower half of the trench exposed a deep deposit of natural, clayey loam alluvium (see Figure 7).

Figure 154 and Table 24 document and depict the soil-stratigraphic layers exposed in excavation at Trench #22. Figure 155 is an overview photograph of Trench #22 at the base (completion) of excavation at a maximum depth of 180 cmbs. Bedrock consists of lithified coral shelf.

Figure 156 and Figure 157 show details of the soil-stratigraphy, which generally consists of the following sequence: a relatively deep (20 to 30-cm thick) topsoil (Layer I) atop a typical (for the current project area) late historic/early modern fill deposit (Layer II); another, relatively thin fill deposit of clean sandy loam with abundant inclusions of crushed coral (Layer III) is directly below this; the basal unit, a clayey loam (Layer IV) of alluvium, represents the C-horizon.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #22 consisted of a relatively small amount of typical (for the current project area) late historic/early modern fill (Layer II), including small pieces of non-diagnostic ferrous metal, glass and ceramics. Based on observations throughout the project area, Layer II clearly represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

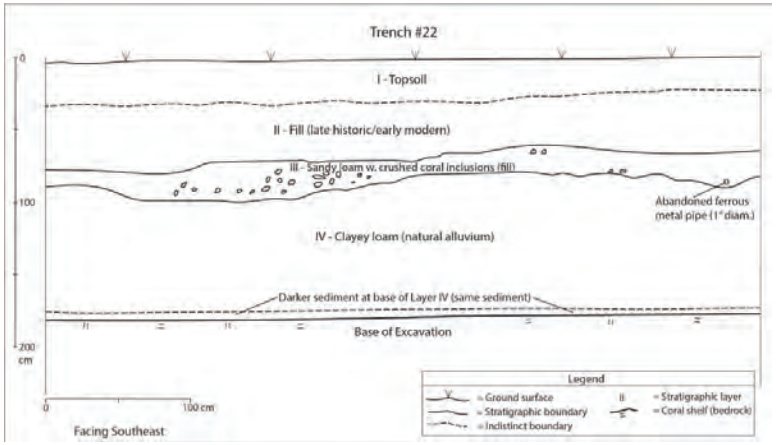

Figure 154. Stratigraphic profile of Test excavation (Trench) #22

Table 24. Summary of Soil-stratigraphic Units in Trench #22

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
I	0-20/30	20-30	Dark brown 10YR 3/3 sandy loam w. soil peds & structure; moderately loose consistency	Modern trash
II	20/30-65/75	35-50	Dark yellowish brown 10YR 3/4 sandy loam; moderately hard (compact) consistency; some pebble- and cobble-size rocks	Fill layer w. late historic/early modern debris including ferrous metal, glass, and blue ware ceramics
III	65/75-85/100	10-25	Dark brown 10YR 3/3 sandy loam w. abundant crushed coral inclusions; abundant angular (gravel-shaped) pebbles; moderate to loose consistency	Fill layer, no cultural material except for a small (1-inch diam.) ferrous-metal pipe at base of layer
IV	85/100-150	50-65	Dark reddish brown 5YR 3/3 clayey loam; moderate to hard consistency; structureless; includes saprolitic staining; lowermost 5-10 cm of sediment is darkened compared with rest of layer	Natural layer (alluvium), no cultural material – C-horizon

Figure 156. Detail of a portion of northwest-facing profile wall at Trench #22, base of excavation, view southeast

Figure 157. Detail of a portion of southeast-facing profile wall near north end of Trench #22, base of excavation, view north

Trench #23

Trench #23 exposed a relatively shallow (65-cm deep) deposit that consisted of nearly exclusively disturbed sediments, and included live utilities (a 3-inch diameter copper pipe of unknown function and a pair of older, supposedly abandoned communications wires still retaining low voltage) (see Figure 7). A very thin (5-10 cm thick) band of natural sediments (cinder and clay) was exposed at the bottom of the excavation, in the north end of trench.

Figure 158 and Table 25 document and depict the soil-stratigraphic layers exposed in excavation at Trench #22. Figure 159 shows live (low voltage) electrical wires broken during excavation of the upper layer at Trench #23 (note, excavation of this trench was temporarily suspended until utility repair could be completed).

Figure 160 and Figure 161 are overview photographs of Trench #23 at the base (completion) of excavation at a maximum depth of 65 cmbs. Bedrock consists of lithified coral shelf.

Figure 162 shows details of the soil-stratigraphy, which generally consists of the following sequence: a mixture of modern fill and loamy topsoil (Layer I) that varies substantially in depth from very shallow at its south end—where it sits atop an older asphalt/concrete surface, to deeper in the middle—where it rests atop the coral shelf (bedrock). At the north end of the trench, a thin band of cinder mixed with clay rests directly below the modern fill and atop the bedrock. There is no evidence of the ubiquitous late historic/early modern fill deposit in Trench #23.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Other than modern debris and utilities, no cultural material was observed in Trench #23.

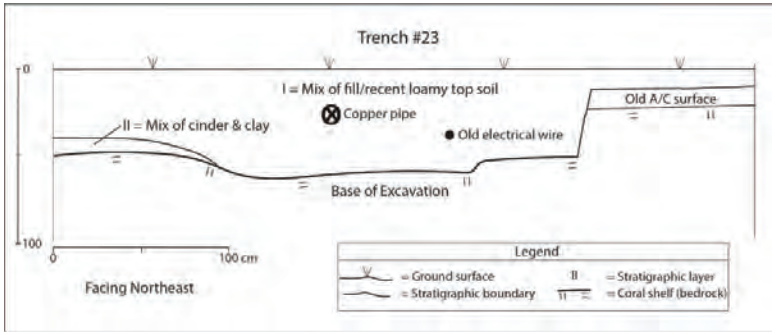

Figure 158. Stratigraphic profile of Test excavation (Trench) #23

Table 25. Summary of Soil-stratigraphic Units in Trench #23

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
I	0-10/65	10-65	Dark brown 10YR 3/3 sandy silt w. soil peds & structure; very loose consistency; abundant rocks of all sizes including a few small boulders	Disturbed fill layer with modern trash
II	40-50	10	Mixture of clay and cinder: (1) multi-colored cinder; loose, structureless; (2) Dark reddish-brown 5YR 3/2 extremely hard clay; no inclusions	Natural (remnant) sediment

Figure 159. Live electrical wires broken during excavation of upper layer at Trench #23; note, excavation of this trench was temporarily suspended until utility repair could be completed

Figure 161. Overview of Trench #23 at base of excavation, view northeast

Figure 162. Detail of a portion of northwest-facing profile wall at Trench #23, base of excavation, view southeast

Trench #24

Trench #24 exposed a natural alluvium (Layer III) in the lower two-thirds of its deposit (see Figure 7). A typical (for the current project area) late historic/early modern deposit (Layer II) was capped by a narrow (5-15 cm thick), discontinuous layer of loose beach sand (Layer Ic), the only such sand in project area.

Figure 163 and Table 26 document and depict the soil-stratigraphic layers exposed in excavation at Trench #24. Figure 164 and Figure 165 are overview photographs of Trench #24 at the base (completion) of excavation at a maximum depth of 200 cmbs. Bedrock consists of undulating, decomposing basalt.

Figure 166 shows details of the soil-stratigraphy, which generally consists of the following sequence: a typical topsoil (Layer Ia) atop an older topsoil (Layer Ib) over a discontinuous, relatively thin (5 to 15-cm) loose beach-sand deposit; this deposit is described in more detail below. A typical (for the current project area) late historic/early modern fill deposit (Layer II) was located below the beach-sand layer. The basal unit, a silty clay (Layer III) alluvium, represents the C-horizon.

Figure 167 and Figure 168 show the sand layer during exposure by hand excavation. The layer was first spotted at approximately 40-45 cm below ground surface. At this point, we stopped machine excavation, and used a flat-edged shovel to skim off the sand a few centimeters at a time. The layer was more or less completely removed by 55-60 cmbs. As noted, this was the only beach sand observed in the project area. It contained small amounts of small marine shells representing naturally-occurring material (not midden), and a few small, smooth (waterworn) pebbles, which are also a natural (rather than artificial) component of the layer.

The table below includes detailed soil-sedimentary descriptions for each layer, including depths below ground surface, range of depths, and cultural materials, if any. Cultural material observed in Trench #24 consisted of a relatively small amount of typical (for the current project area) late historic/early modern fill (Layer II), including small pieces of non-diagnostic ferrous metal and glass. Based on observations throughout the project area, Layer II clearly represents a widespread bulldozing event we believe occurred right before the middle 1950s construction of the Mayor Wright Homes. We discuss this evidence in more detail after the results section (see Significance Assessments).

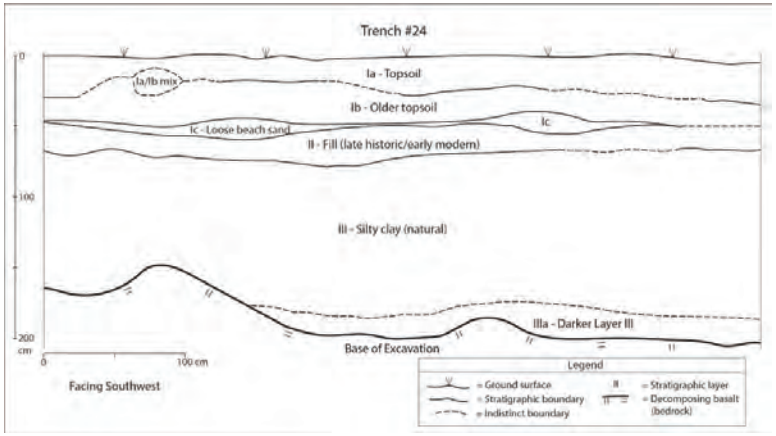

Figure 163. Stratigraphic profile of Test excavation (Trench) #24

Table 26. Summary of Soil-stratigraphic Units in Trench #24

Layer	Depth (cmbs)	Thickness (cm)	Sedimentary Description	Cultural Material/Comments
Ia	0-15/30	15-30	Dark brown 7.5YR 3/2 clayey loam w. soil peds & structure; loose consistency; abundant micro-inclusions of shell and lithified coral; abundant rootlets	Modern trash
Ib	15/30-40/50	15-30	Darker version of same sediment description as above (Layer Ia)	Modern trash
Ic	40/50-50/60	5-15	Very pale brown 10YR 7/4 loose beach sand w. small marine shells (not midden), few small smooth (waterworn) pebbles (not artifacts)	Fill layer component
II	50/60-65/80	15-25	Very dark grayish brown 10YR 3/2 (looks white or yellow in the field) clay; hard consistency; structureless; poorly sorted; abundant small inclusions of lithified coral & shell	Fill layer w. late historic/early modern debris including small amount of non-diagnostic ferrous metal and glass
III	65/80-150/175	80-120	Brown 7.5YR 4/4 (looks orange in the field) silty clay; well-sorted, medium-hard consistency; clods and small blocky structure; abundant multi-colored (saprolitic) mottling	Natural layer (alluvium), no cultural material – C-horizon
IIIa	175/185-200	15-25	Darker basal layer of same sediments as Layer III; very dark brown 7.5YR 2.5/3	Natural layer (alluvium), no cultural material – C-horizon

LABORATORY RESULTS

As described in the Methods section, we collected historic artifacts that retained chronologically-diagnostic information, such as glass bottles with maker's marks and other indicators of their place and/or time of manufacture. As summarized in Table 27, a total of eighteen (18) glass bottles were collected for description and analysis from four (4) excavation units (Trench #s 14, 17, 19 and 20). Theo Monahan assisted Chris Monahan in all analysis and research on these artifacts. The bottles we were able to identify indicate earliest dates of manufacture were no earlier than the 1920s. The latest (Catalogue #17) is form the 1950s. All of the glass bottles are depicted with photographs that follow the table. Photograph numbers for each catalogue number are listed in the table.

Table 27. Accessioned Glass Bottles from Mayor Wright Homes Project Area Excavations

Cat. #	Trench #	Provenience	Description and Comments
1	20	Site 8033, Feature 4, 60-200 cmbs	Clear glass, complete, medicine bottle, with stylized number "8" on bottom; Figure 169
2	20	Site 8033, Feature 4, 60-200 cmbs	Clear glass, complete, perfume bottle; with letter "K" embossed on bottom; **matches the Knox Glass Bottle Co., manufactured from 1932-1968;** Figure 169

CONCLUSION

On behalf of Hunt Companies, Inc., TCP Hawai'i, LLC, has completed the first part of Archaeological Inventory Survey (AIS) work in an approximately 15.3-acre project area in Honolulu in support of the Mayor Wright Homes Redevelopment Project (TMK [1] 1-7-029:003). As described below, *there will be some additional AIS testing when the existing buildings in the project area are demolished*. The landowner is the Hawai'i Public Housing Authority (HPHA).

For the purposes of this AIS, the Area of Potential Effect (APE), synonymous with "project area" in this report, is the same as the physical footprint of the TMK parcel. We use the term "direct APE" throughout this report to refer specifically to the APE for archaeological resources (to distinguish it from the broader APE for architectural resources that may include more indirect effects).

The direct APE/project area is bounded by N. King St., Pua Lane, Vineyard Blvd., and Liliha St. in a thoroughly urbanized/developed part of Honolulu just west of the channelized lower Nu'uanu Stream. Iwilei is just makai (seaward) of the project area; Kalihi and Kapālama are to the 'Ewa (west) side; Chinatown and the old center of Honolulu are located to the Diamond Head (east) side.

As documented in Table 28, and graphically depicted in Figure 35 (above, at the start of the Fieldwork Results section), we identified four (4) historic properties: State Inventory of Historic Places (SIHP) # 50-80-14-8033, SIHP # 50-80-14-8034, SIHP # 50-80-14-8035, and SIHP # 50-80-14-8036.

- **Site 8033**—exposed in nearly all (21 of 24) of the trenches—is a subsurface layer, consisting of four (4) features. *Feature 1* is the widespread layer, itself. Trench #12, along the southwest boundary of the project area, is the only excavation where this subsurface layer is entirely missing (in the other two, Trench #s 11 and 23, this layer may have been removed by recent/modern disturbance). *Features 2 through 4* are filled-in garbage/debris pits emanating from the base of the subsurface layer (in Trench #s 16, 19 and 20, respectively). This site represents a project-area wide grading/bulldozing and pit-filling (dumping) event that occurred just prior to, and in preparation for, the construction of the Mayor Wright Homes residential complex (circa 1952-3). The site covers an area of approximately 14.0 acres. It is a subsurface layer with a great deal of variation in terms of its depth and thickness; it generally occurs between 20-30 cm below ground surface (upper limit of layer), with some trenches exposing this layer as shallow as 10-15 cm below ground surface (upper limit of layer), down to an average of 40-60 cm below ground surface (lower limit of layer), with some variation from this. Average thickness of this layer is approximately 30-50 cm.

- **Site 8034**—exposed in several trenches in the mauka (inland) portion of the project area (Trench #s 6, 7, 10, 15 & 17), is a subsurface layer consisting of gray clay interpreted as pond sediments, most likely the remnants of traditional Hawaiian lo'i kalo (irrigated, pond-field, taro cultivation). There is abundant historical evidence that, in pre-Contact times—before the development of Honolulu Harbor and in the early nineteenth century and subsequent urbanization—the project area represented a prime location for traditional Hawaiian subsistence cultivation of taro; and such activities continued in some portions into the early twentieth century. The upper portion of this sedimentary layer—and this site—appear to have been partially truncated by the grading/bulldozing. This site is discontinuous in its areal distribution, and its overall area is unknown. It is a subsurface layer with a great deal of variation in terms of its depth and thickness; it generally occurs between 20-65 cm below ground surface (upper limit of layer), with one trench (Trench #17) exposing this layer as deep as 95 cm below ground surface (upper limit of layer), down to an average of 60-90 cm below ground surface (lower limit of layer), with one deeper instance (Trench #17). Average thickness of this layer is approximately 40 cm.

- **Site 8035** consists of two features: Feature 1, an asphalt or concrete surface (exposed in Trench #11) dating from the late historic/early modern period. This old surface starts at 40 cm below the ground surface, and extends to an unknown depth (probably 10-15 cm). We do not know its area; and Feature 2, another (different) asphalt surface (exposed in Trench #12) dating from the late historic/early modern period. This old surface is located between 25-40 cm below the ground surface. We do not know its area.

- **Site 8036** is a set of very large drainage pipes (exposed in Trench #21) also dating from the late historic/early modern period. These large pipes are located between 75-140 cm below the ground surface. They extend to the north and south and unknown distance.

We conclude this AIS report by first presenting our Significance Assessments for these historic properties; next, we discuss the Project Effect and Mitigation Recommendations (see Table 28).

Significance Assessments (Evaluations)

Because this project is reviewable under both State and Federal laws, we include consideration of *both* State and Federal significance criteria (evaluation), which are very similar in content and purpose.

In accordance with State administrative rules (cf. HAR § 13-284-6), significance of a historic property is evaluated by first establishing that it possesses "integrity of location, design, setting, materials, workmanship, feeling, and association," and, second, that it meets one or more of the following criteria:

a. Be associated with events that have made an important contribution to the broad patterns of our history;
b. Be associated with the lives of persons important in our past;
c. Embody the distinctive characteristics of a type, period, or method of construction; represent the work of a master; or possess high artistic value;
d. Have yielded, or is likely to yield, information important for research on prehistory or history; or
e. Have an important value to the native Hawaiian people or to another ethnic group of the state due to associations with cultural practices once carried out, or still carried out, at the property or due to associations with traditional beliefs, events or oral accounts--these associations being important to the group's history and cultural identity.

Under Federal standards, site significance was evaluated with regard to the criteria in the Code of Federal Regulations (CFR), Title 36, Part 60.4, as follows:

> The quality of significance in American history, architecture, archeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:
>
> A. That are associated with events that have made a significant contribution to the broad patterns of our history; or
> B. That are associated with the lives of persons significant in our past; or
> C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
> D. That has yielded or may be likely to yield information important in prehistory or history.

Table 28. Historic Properties in Project Area, Significance Assessments and Recommended Mitigation

SIHP #*	Formal Type	Function	Age	Sign. Assess.**	Recomm. Mitig.***
8033	Subsurface cultural layer (4 features)	Site preparation for construction of Mayor Wright Homes	1952-3	d, D	NFW
8034	Subsurface loʻi kalo sedimentary layer (remnant)	Traditional, Hawaiian, irrigated taro pond-fields	Pre-Contact to historic period	d, D	NFW
8035	Subsurface asphalt/concrete surface (2 features)	Pavements, driveways or other similar surfaces	Early 20th century	d, D	NFW
8036	Pair of buried (subsurface) drainage pipes	Major drainage infrastructure	Early to middle 20th century	d, D	NFW

* Complete, formal State Inventory of Historic Places (SIHP) # is preceded by "50-80-14."
** Significance Assessments: lower case letters = Hawaiʻi State criteria; upper case letters = Federal criteria
*** Recommended Mitigation: NFW = No further (historic-preservation or archaeological) work

SIHP # 50-80-14-8033 is evaluated as significant under criteria d (State) and D (Federal) for its intrinsic informational value to research on the history of middle twentieth century urbanization in Honolulu, in particular, the advent of major public housing initiatives—and construction of the Mayor Wright Homes—by the State of Hawaiʻi.

SIHP # 50-80-14-8034 is evaluated as significant under criteria d (State) and D (Federal) for its intrinsic informational value to research on the history of traditional Hawaiian agricultural practices in pre-Contact times as well as the later, historic period in Honolulu and the lower Nuʻuanu flood plain west of the stream.

SIHP # 50-80-14-8035 is evaluated as significant under criteria d (State) and D (Federal) for its intrinsic informational value to research on the history of early to middle twentieth century urbanization in Honolulu, in particular, land use in the project area prior to the construction of the Mayor Wright Homes.

SIHP # 50-80-14-8036 is evaluated as significant under criteria d (State) and D (Federal) for its intrinsic informational value to research on the history of middle twentieth century urbanization in Honolulu, in particular, the advent of major public housing initiatives—and construction of the Mayor Wright Homes—by the State of Hawaiʻi.

Project Effect and Mitigation Recommendations

Sufficient documentation of the four (4) historic properties identified in this AIS report has now been completed, and TCP Hawaiʻi recommends no further archaeological or historic preservation work is needed for these four sites.

During consultation with the SHPD-Archaeology Branch, the issue of archaeological testing (excavation) under the existing buildings—once they are demolished (they are currently occupied by hundreds of residents)—was raised as a possible, additional round of AIS fieldwork (e.g., as a Supplemental AIS report). Given the totality of evidence gathered during AIS fieldwork, including (1) the presence of a project-area wide grading/bulldozing event that appears to have leveled the entire property of any previous structural remains; (2) the complete lack of any possible basalt boulders (potential traditional, Hawaiian rock-structural remains) in the excavated trenches, other than late historic/early modern pit fills; (3) the complete absence of any naturally-occurring deposits of clean beach/dune sand that typically

contain traditional, Hawaiian burials; and (4) historical evidence that the entire project was a network of pond-field taro gardens (and, thus, not a favored place for burials), we believe such additional testing (excavation) beneath the existing buildings yield more of the same kind of evidence we have already documented. *However, in order to ensure there are no as-yet undiscovered areas with potentially significant archaeological resources, or burials, we recommend a second round of AIS testing (excavation) in the footprints of some of the existing residential structures, when they are demolished in the future*. We recommend a total of 12 additional trenches placed under 12 of the existing buildings (once they are vacated). This additional AIS work can be submitted to the SHPD for review and comment as a Supplemental AIS report.

Figure 190 is a schematic, preliminary depiction of what an additional 12 trenches in a second round of AIS testing would look like. This is a draft figure to be used for discussion/consultation purposes only.

Because inventory and identification steps are incomplete at this time, we are not ready to recommend an effect determination—in accordance with HAR § 13-275-7—at this time. Likewise, since the inventory and identification steps are incomplete, we are not ready to recommend an effect determination under Section 106 (36 CFR Part 800) either. When we have completed sufficient AIS testing, we will recommend such legally-mandated determinations for SHPD concurrence.

Figure 190. Schematic, preliminary depiction of what an additional 12 trenches (yellow) in a second round of AIS testing would look like; note, this is a draft figure to be used for discussion/consultation purposes

APPENDIX A: CONSULTATION CORRESPONDANCE

This appendix includes all formal consultation sent by TCP Hawai‘i, LLC, in support of this project. It also includes one formal, written response we received (from OHA).

Documents included in this appendix:

1. Pages A-2 to A-7: Sample of initial consultation outreach letter sent to the following individuals and agencies in late May/early June, 2016: (a) SHPD/DLNR (Administrator Downer, Archaeology Branch Chief Susan Lebo, O‘ahu Burial
   Site Program staff Regina Hilo, and Ka‘āhiki Solis); (b) OHA (Ka Pouhana/CEO Crabbe and staff in Compliance, Kai Markell and Lauren Morawski); (c) Kalihi-Palama Neighborhood Board (Chair Ryan Mandado); (d) Kalihi-Palama Hawaiian Civic Club (Pelekikena/President Leimomi Khan); (e) Cynthia Yoshida (Public Housing Supervisor, MWH); (f) Historic Hawaii Foundation (Kirsten Faulkner); (g) Ka‘anohi Paulette Kaleikini (Native Hawaiian, cultural descendant, Honolulu area); (h) Michael Lee (Native Hawaiian, cultural descendant, Honolulu area).
2. Page A-8: Formal, written response from OHA dated June 28, 2016.
3. Pages A-9 to A-10: Final trenching plan (scope of work for fieldwork) dated September 8, 2016, prepared by TCP Hawai‘i for SHPD based on multiple formal meetings with SHPD.
4. Page A-11: End of fieldwork summary email dated October 12, 2016, prepared by TCP Hawai‘i for SHPD.

TCP Hawai‘i, LLC

Documenting Traditional Cultural Properties of Hawai‘i
Preserving and Restoring Cultural and Natural Resources of Hawai‘i

May 25, 2016

To: **Mr. Kamana‘opono Crabbe, Ph.D., Ka Pouhana (CEO), Office of Hawaiian Affairs, State of Hawai‘i**

Re: **Initiation of Section 106 (36 CFR Part 800) Consultation for Mayor Wright Homes Redevelopment Project, Honolulu Ahupua‘a, Honolulu (Kona) District TMK (1) 1-7-029: 003**

Aloha Mr. Crabbe,

On behalf of the lead agency for the proposed undertaking, the U.S. Department of Housing and Urban Development (HUD); and the landowner, the Hawai‘i Public Housing Authority (HPHA); and in coordination with its national planner, Hunt Companies, Inc.; and its local planner, PBR Hawaii & Associates, Inc., TCP Hawai‘i, LLC, is conducting an Archaeological Inventory Survey (AIS) and a Cultural Impact Assessment (CIA) of an approximately 15.3-acre project area in Honolulu in support of the Mayor Wright Homes Redevelopment Project (TMK [1] 1-7-029:003).

The Area of Potential Effect (APE) is the same as the physical footprint of the TMK parcel; and is synonymous with the term "project area," which is bounded by N. King St., Pua Lane, Vineyard Blvd., and Liliha St. in Honolulu (**Figure 1** and **Figure 2**). The APE/project area is located in a thoroughly urbanized/developed part of Honolulu: Iwilei is located just makai (seaward) of the project area; Kalihi and Kapālama are to the ‘ewa (west) side; Nu‘uanu and Chinatown are located to the northeast and southeast, respectively.

The purpose of this consultation letter is (1) to provide notification that this project could affect historic properties of interest to you; (2) to seek your views on the methods by which we will identify and evaluate historic properties in the project area; and (3) to solicit your views on the proposed undertaking's potential effects on historic properties.

We also seek your input as to other interested parties with whom you believe we should be consulting. At the end of this letter, we list other organizations and individuals with whom we have also initiated consultation for this proposed undertaking.

This letter represents only the start of our formal consultation efforts with you. We will continue to consult, formally as well as informally, throughout the entire process of conducting our AIS and CIA investigations; and we will continue to seek your views on the identification of historic properties, their evaluation, and mitigation of any adverse effects.

Proposed Undertaking

Mayor Wright Homes (public housing complex built by the HPHA) were first occupied in 1952 or 1953 (depending on the source), making them some 63 or 64 years old.[1] The proposed undertaking will replace the existing 364 residential units—currently consisting of 35 separate, low-rise buildings (plus an administration building)—with 1,000–1,500 residential units and other mixed-use structures; the new development will include low, medium and high-rise buildings. This project is considered to be part of the Transit-Oriented Development (TOD) associated with construction of the Honolulu Rail Transit Project.

Cultural and Historical Background

The entire project area is more or less full of Land Commission Awards (LCAw), or kuleana parcels, dating from the middle-nineteenth century legal process of land division and private ownership known as the Māhele.[2] There are more than two dozen LCAs wholly or partially within the project area, or immediately adjacent to its boundaries (**Figure 3**). Preliminary analysis of these records indicates the project area represented prime, irrigated taro lands in or immediately adjacent to the lower floodplain of Nu'uanu Stream, with traditional irrigation ditches ('auwai) and scattered house sites dotting the landscape.

A Hawaiian Kingdom government survey map from 1887 depicts a large residential structure labelled "R. Keliiokolani" (i.e., Princess Ruth Ke'elikōlani) in the southwest corner of the project area, but no other structures; the 1906 series of Dakin Fire Insurance maps shows many structures throughout most of the project area with the vast majority labelled as "dwellings" or "tenements." Interestingly, much of the eastern quadrant of the project area was still being used to grow taro and other plants. A tofu-making operation was located along Pua Lane. A "Japanese hotel" and several horse stables and facilities were also scattered about the project area.

These and other historical maps and documentation indicate the project area has been heavily developed/urbanized for over 100 years; before this, in the nineteenth century and in "precontact" times, the project area was full of traditional Hawaiian lo'i kalo (irrigated taro gardens). At least some small house sites were also located in the project area. It is unlikely that the project area would have been used for burials prior to the historic period. These were prime agricultural lands. However, following the social disruptions caused by the arrival of Americans, Euroamericans and Europeans around 1800 and increasingly in the early nineteenth century, burial practices may have changed as traditional access to the entire ahupua'a was cut off. Thus, it is possible that some "backyard burials" may have taken place in the nineteenth century in the project area.

Previous and Proposed Cultural Resource Evaluations in the Project Area

To the best of our knowledge, there have not been any formal archaeological surveys or cultural resources assessments in the project area, since the existing Mayor Wright Homes was completed prior to the introduction of environmental and historic-preservation laws (starting in the 1960s).

Our AIS will be conducted in accordance with Hawai'i Administrative Rules (HAR) § 13-276; we will consult with the SHPD to develop an appropriate scope of work to ensure all historic properties are identified. Our CIA will be conducted in accordance with Hawai'i Revised Statutes (HRS) § 343 and HAR § 11-200, as well as the State Office of Environmental Quality Control's (OEQC) 2012 *Guide to the Implementation and Practice of the Hawaii Environmental Policy Act.*

[1] The above-ground, architectural structures in the APE/project area are being evaluated by Fung Associates, Inc.
[2] The areas on the 1939 map where there are no LCAs depicted, but where Land Court Application numbers appear, conceal still more LCAs that will be documented and analyzed in our investigations.

Consultation Process for this Project to Date

In addition to your agency, we have also initiated formal consultation efforts with the following individuals and organizations:

- State Historic Preservation Division, Department of Land and Natural Resources
- O'ahu Island Burial Council
- Ms. Paulette Kaanohiokalani Kaleikini
- Ms. Cynthia B. Yoshida (Public Housing Supervisor at Mayor Wright Homes)
- Kalihi-Palama Hawaiian Civic Club
- Kalihi-Palama Neighborhood Board (No. 15)

If you know of other individuals or organizations with whom you believe we should consult, we request that you kindly share this information with us.

Please feel free to contact me via email, regular mail or phone if you have any questions about this consultation letter.

To: **Susan Lebo, Ph.D., Archaeology Branch Chief, SHPD/DLNR**
Re: **Continuing Consultation for Mayor Wright Homes Redevelopment Project, Honolulu Ahupua'a, Honolulu (Kona) District, TMK (1) 1-7-029: 003**

Aloha Dr. Lebo,

This letter is in reference to the trenching plan we discussed on September 2, 2016, for the HAR § 13-276 AIS we are conducting at Mayor Wright Homes. This was our second consultation regarding the number and placement of trenches needed to satisfy the AIS requirements for this project.

The purpose of this letter is to obtain your concurrence for our trenching plan so we can begin fieldwork.

Figure 1 is our final plan for 24 trenches. We have had to consider several factors in our placement of trenches: (1) the project area is currently home to some 1,000 low-income people—thus, we are trying to minimize disruption to their lives; (2) the location of underground utilities, which we are trying to avoid; (3) the possible location of subsurface historic-age features, based on maps from the early 1900s, which we are trying to target with some of our trenches (see legend to Figure 1 for historic map sources).

As we discussed in the most recent meeting, depending on the results of our excavation of these 24 trenches, we understand additional trenches may be needed. Furthermore, as discussed, some kind of AIS testing will have to occur in the future underneath some of the existing buildings in order to achieve adequate coverage of trenching. We discussed two possible strategies for completing AIS testing underneath the existing buildings (once they are demolished), including conducting a Supplemental AIS to document these currently-inaccessible sediments.

We would greatly appreciate receiving your concurrence in writing (email) as soon as possible.

Please contact me if you have any questions about this consultation letter.

With aloha,

Christopher M. Monahan, Ph.D.
Owner, Principal Investigator, TCP Hawai'i, LLC

c: Kimi Matsushima, O'ahu Lead Archaeologist, SHPD/DLNR

Figure 1. Location of 24 proposed trenches at Mayor Wright Homes Redevelopment project area with historic feature overlays (see legend and text of this letter); note, small black (1908-1909) squares and rectangles are house sites on historic maps; small blue (1920-1925) rectilinear shapes are house site locations associated with 'auwai system

[email from Chris Monahan to SHPD dated October 12, 2016]

Aloha Kimi and Susan,

About a week ago, we completed all fieldwork tasks--including recording mapping grade (sub-foot accurate) GPS (Trimble) locations of all testing locations--associated with the backhoe excavation of 24 trenches at Mayor Wright Homes (MWH). Trench locations were mostly according to the general trenching plan we (Kimi and I) agreed to on or around Sept 9, although toning for underground utilities prior to digging (on Sept 19) required us to slightly adjust/move nearly all trenches (typically, we needed to adjust orientation to avoid water and gas lines). We hit unmarked utilities (mostly dead, but not always) in about half of our trenches. It's a very busy project area in that way.

We did not identify any traditional Hawaiian artifacts, sites or features. We did not identify any human skeletal remains or burials (we found a few cow bones here are there, consistent with late historic food debris). We did find a late historic debris layer throughout more or less the entire project area containing diagnostic artifacts (mostly glass bottles with maker's marks and company names) dating from the 1927 (earliest so far) to the 1950s. I'm certain this layer, which typically begins about 15-30 cm below surface and is typically 25-40 cm thick, represents a systematic bulldozing and sediment compaction event that occurred just prior to, and in preparation for, the circa 1954 construction of the current buildings. I am currently searching for photographs to back this up. As part of this widespread late historic layer, we also identified a few discrete features (filled-in pits/depressions) containing late historic artifacts. We collected about 20 diagnostic artifacts from these features and this layer. Preliminary evaluation is we have a single historic property (late historic debris layer associated with the establishment of the current, circa 1954 building complex) with several features (the deeper filled-in pits/depressions with late historic artifacts in them).

The base of excavation varied from lithified coral shelf (in about a third of the trenches, usually about 1.0-1.5 m in depth), to the water table (in a few, below 2.2 m in depth) and decomposing bedrock (basalt) boulders/saprolitic regolith (typically 1.8-2.0 m in depth). Along the western side of the project area, we identified several instances of lithified coral shelf covered by loose cinder, presumably dating to a locally widespread event approximately 8,000 yrs BP centered on Punchbowl. The cinder fills in cracks and crevices and even what appear to be surface drainages in the lithified coral shelf. At first, we thought we might be looking at ditches and `auwai--that is, cultural features, but close inspection and study led to the interpretation that these were natural, and far older, landscape features. We also identified what appear to be ponded (lo`i) sediments (a gray clay) in quite a few trenches, below the late historic layer, but well above the base of excavation. I grabbed a sample of this probably lo`i sediment for closer inspection.

Only in one trench did we observe natural beach sand, or anything resembling possible Jaucus sand, and I immediately stopped mechanical excavation and commenced hand shovel work with a flat edged shovel. It turned out to be a discontinuous lens, 10-15 cm maximum, just part of the late historic filling event (thankfully).

Question and a request for assistance: can you please recommend references/sources for helping me further identify the glass bottles' maker's marks, etc. I know there are a few relevant to Hawai`i/Honolulu, just that it's not my area of expertise.

Mahalo for your help.

Chris

APPENDIX B: TABLE OF PREVIOUS ARCHAEOLOGICAL RESEARCH

This appendix includes a table of previous archaeological studies near the project area from a recent, SHPD-approved AIS by Belluomini et al. (2016:42–45).

Table 1. Previous Archaeological Studies in the Vicinity of the Project Area

Reference	Type of Study	Project	Results (SIHP #s 50-80-14**** unless otherwise noted)
Landrum and Dixon 1992	Data recovery	River-Nimitz redevelopment	Identified four post-Contact trash pits, a brick and motor building foundation, and a single pre-Contact human burial; all documented archaeological features designated SIHP # -4192
Erkelens et al. 1994	Burial report	Kekaulike project	Documented SIHP # -4875, four sets of human skeletal remains at the Kekaulike project, Diamond Head Block, identified during inventory survey and data recovery investigations
Kennedy et al. 1994	Archaeological inventory survey	Kekaulike revitalization	Identified SIHP # -4857, a small fishpond, and SIHP # -4588, a multi-component site consisting of 53 features dating from the twentieth century to pre-Contact including three human burials
Riley et al. 1995	Data recovery	Kekaulike revitalization project, 'Ewa block	Identified 55 features spanning the early pre-Contact period through the twentieth century; radiocarbon dating of SIHP # -4587, a small fishpond, yielded an early tenth century date and dating of a coral reef stone platform (SIHP # -4588) yielded an eleventh century date
Goodwin et al. 1995; Goodwin et al. 1996	Archaeological inventory survey, data recovery, and monitoring	Marin Tower	Entire Marin Tower property designated SIHP # -4494 consisting of 28 post-Contact burial features and the remains of several displaced human skeletal remains, pre-Contact fire pits, and early post-Contact structural foundations associated with the residence of the Marin family from about 1810 to 1850; numerous pre- and post-Contact artifacts also documented
Athens and Ward 1997	Paleoenvironm-ental study	Liliha Civic Center	Indicated Kūwili Fishpond constructed between AD 1400-1650

Reference	Type of Study	Project	Results (SIHP #s 50-80-14**** unless otherwise noted)
Goodwin 1997	Archaeological inventory survey	Kekaulike project, Diamond Head block	Identified a multi-component site (SIHP # -4875) consisting of 105 features and six culturally enriched sediment strata; majority of features identified as Native Hawaiian from the early post-Contact period, but included later historic and modern features and structural remnants; documented a single burial
Heidel and Hammatt 1997	Archaeological testing	Testing of 1,700-sq-ft lot in Chinatown	Four test trenches revealed no cultural deposits or materials
McGerty et al. 1997	Archaeological inventory survey	Liliha Civic Center	Identified soil layers interpreted as remains of Kūwili Fishpond (SIHP # -5368) and suggested the pond may have been constructed as early as AD 1100
Lebo and McGuirt 2000a and b	Archaeological inventory survey and data recovery	Nimitz Hwy water system improvements, downtown Honolulu	Identified one historic property: SIHP # -5496, subsurface cultural layer containing both pre- and post-Contact archaeological features
Elmore and Kennedy 2001	Archaeological monitoring	City and County of Honolulu Misc sidewalk improvements	Identified one in situ flexed human burial, SIHP # -5781, between Maunakea St and Smith St
McDermott and Mann 2001	Archaeological inventory survey	Nimitz Hwy water system improvements	Focused on investigations of Kawa Fishpond (SIHP # -5966)
Winieski and Hammatt 2001	Archaeological monitoring	Nimitz Hwy reconstructed sewer	Identified a historic brick-lined manhole and a remnant of a light-gauge rail, SIHP # -5942, associated with the historic Honolulu Rapid Transit trolley system at the intersection of Queen St and Nimitz Hwy
Mann and Hammatt 2002	Archaeological monitoring	King St rehabilitation	Identified one incomplete, previously disturbed, human burial, SIHP # -6317, near the intersection of S. King St and Punchbowl St and a pit feature containing non-human skeletal remains at the corner of S. King St and Richards St

Reference	Type of Study	Project	Results (SIHP #s 50-80-14**** unless otherwise noted)
West et al. 2002	Archaeological monitoring	Installation of water mains along King St, between Liliha and River streets	Identified previously recorded Honolulu Rapid Transit & Land Company (HRT&L) trolley (SIHP # -5942) along with numerous artifacts in association
Pietrusewsky 2003 (in Kailihiwa and Celghorn 2007)	Osteological analysis	Smith-Beretania parking lot	Identified two children, five young adults, and 16 adults and individuals consistent with Hawaiian/ Polynesian/Asian ancestry (SIHP # -6672)
Goodwin and Allen 2005	Data recovery	Kekaulike project, Diamond Head block	Excavated four house compounds and a blacksmith's shop (SIHP # -4875); radiocarbon dating indicated the area was in use as early as the thirteenth century, with the majority of documented features associated with the early pre-Contact period; four human burials documented
Hammatt 2005	Burial report	Foster Botanical Gardens (180 North Vineyard Blvd)	Recovered maxilla fragment and portion of a long bone, clavicle, fragments of a mandible, loose teeth and rib fragments from backpile; reinterred remains on grounds of botanical gardens (No SIHP # assigned)
McIntosh and Cleghorn 2005	Archaeological inventory survey	Pearl St One Bldg	Identified SIHP # -6691, a four-component site comprised of two disturbed human remains, two historic trash pits, charred remains of a Chinatown structure destroyed in the 1900 Chinatown fire, and the remnant of a historic building that partially collapsed in 2001
McIntosh et al. 2006	Archaeological inventory survey	Smith-Beretainia parking lot	Identified SIHP #50-80-12-6672, including trash pits, cooking feature, building structural foundations, traditional and historic artifacts, and abundant midden deposits

Reference	Type of Study	Project	Results (SIHP #s 50-80-14**** unless otherwise noted)
Dagher and Spear 2007	Archaeological monitoring	Pacific Town Gateway Center	Identified two historic properties: SIHP # -6889, two human burials, likely Native Hawaiian; and SIHP # -6926, a mortared basalt foundation wall and a ceramic storm drain containing a cache of ceramics
Kailihiwa and Cleghorn 2007	Archaeological monitoring	Smith-Beretania parking lot	Identified SIHP # 50-80-12-6672, including 23 sets of human remains
Groza and Hammatt 2008	Archaeological monitoring	Rehabilitation of Streets	No intact cultural deposits or materials encountered, likely due to previous disturbance
Hammatt et al. 2008	Archaeological data recovery	Iwilei senior housing	Collected and analyzed sediment samples in Kūwili Fishpond (SIHP # -5368); suggested the earliest pond sediments deposited ca. AD 1020 to AD 1120, (most consistent with the estimate of AD 1100 by McGerty et al. [1997], and inconsistent with Athens and Ward's [1997] estimate of the AD 1400s)
Hunkin and Hammatt 2008	Archaeological monitoring	Armstrong Bldg courtyard renovation	No intact cultural deposits or materials encountered
Cleghorn et al. 2012	Data recovery	Smith-Beretania parking lot	Identified SIHP # 50-80-12-6772, consisting of numerous pits, privies, and miscellaneous features including traditional Hawaiian artifacts and two human burials
Hunkin et al. 2012	Archaeological monitoring	Kalihi/Nu'uanu sewer project	Discovered isolated human bone fragment in fill material (not within the vicinity of the project area and no SIHP # assigned)
Hammatt 2013	Archaeological inventory survey	Construction Phase 3 of the Honolulu-High Capacity Transit Corridor	Identified SIHP # 50-80-16-7427, consisting of a human skeletal element and post-Contact subsurface infrastructure remnants, and cultural deposits
Enanoria and Hammmatt 2015	Archaeological monitoring	King St Reconstruction between Bethel and River streets	No intact cultural deposits or materials encountered

APPENDIX C: ALTA SURVEY (2016) OF THE PROJECT AREA

This appendix contains a client-provided map of the project area based on a 2016 ALTA survey; note, the large number of walkways and sidewalks, some of which may be in excess of 50 years in age (i.e., may be components of the above-ground, circa 1952-3, architectural landscape).

Mahalo to the residents of Mayor Wright Homes, and to the many others who assisted me during this project.

ABSTRACT – MANAGEMENT SUMMARY

TCP Hawai‘i, LLC, completed a Cultural Impact Assessment (CIA) of an approximately 15.3-acre project area in Honolulu in support of the Mayor Wright Homes Redevelopment Project (TMK [1] 1-7-029:003). The landowner is the Hawai‘i Public Housing Authority. The project area, which consists of the TMK parcel in the context of the surrounding neighborhoods of Honolulu, is bounded by North King Street, Pua Lane, Vineyard Boulevard, and Liliha Street in a thoroughly urbanized/developed part of Honolulu west of the channelized lower Nu‘uanu Stream. The information has been gathered to support an Environmental Impact Statement (EIS) of the redevelopment of Mayor Wright Homes, a public housing complex built by the HPHA that was first occupied in 1952 or 1953 (depending on the source). The proposed undertaking will replace the existing 364 residential units—currently consisting of 35 separate, low-rise buildings (plus an administration building)—with a new mixed-use, mixed-income development with up to 2,500 residential units and 80,000 square feet of commercial uses (note, at the start of this CIA, the proposed number of new residential units was 1,000 to 1,500, since increased to 2,500). The new development will include low, medium and high-rise buildings. This project is considered to be part of the Transit-Oriented Development (TOD) associated with construction of the Honolulu rail transit project. There have not been any previous CIAs for the project area because the Mayor Wright Homes were completed prior to the introduction of applicable environmental assessment laws (starting in the late 1960s). This CIA satisfies the state Office of Environmental Quality Control’s (OEQC) guidelines for assessing cultural impacts. This document is a synthesis of previously obtained information, new interviews, and details of the proposed project.

In accordance with HRS 6E and Section 106 of the National Historic Preservation Act (NHPA), we conducted extensive community outreach and consultation with numerous individuals and agencies, including Native Hawaiian organizations. The consultation objectives were (1) to provide notification that this project could affect cultural resources and practices of interest to the community; (2) to seek consulted party views on the methods by which we identified and evaluated cultural resources and practices in the project area; and (3) to solicit consulted party views on the proposed undertaking’s potential effects on these things. Through extensive archival research, including historical map analysis and review of Māhele ‘Āina (Land Commission) records, we present detailed information and analysis on a wide variety of topics, including: the Hawaiian cultural landscape, middle nineteenth-century developments in and near the project area, royal residences of Kapālama, early twentieth-century developments in and near the project area, oral history information from the twentieth-century in and near the project area (including interview summaries from a study of Pālama Settlement), results of nearby archaeological studies and a new archaeological survey of the project area by TCP Hawai‘i, and results of new interviews by TCP Hawai‘i conducted for this CIA.

All of this information forms the basis for several recommendations regarding the redevelopment of Mayor Wright Homes.

INTRODUCTION

On behalf of the project proponent, MWH Partners, LLC, and its local planner, PBR Hawaii & Associates, Inc., TCP Hawai‘i, LLC, has completed this Cultural Impact Assessment (CIA) of an approximately 15.3-acre project area in Honolulu in support of the Mayor Wright Homes Redevelopment Project (TMK [1] 1-7-029:003) (Figure 1, Figure 2 and Figure 3).

The landowner is the Hawai‘i Public Housing Authority. For the purposes of this CIA, the project area consists of the TMK parcel in the context of the surrounding neighborhoods of Honolulu. The project area is bounded by North King Street, Pua Lane, Vineyard Boulevard, and Liliha Street in a thoroughly urbanized/developed part of Honolulu just west of the channelized lower Nu‘uanu Stream. Iwilei is just makai (seaward) of the project area; Kalihi and Kapālama are to the ‘Ewa (west) side; Chinatown and the old center of Honolulu are located to the Diamond Head (east) side.[1]

The information in this report has been gathered to support an Environmental Impact Statement (EIS) for the redevelopment of Mayor Wright Homes. There have not been any previous CIAs in the project area because the Mayor Wright Homes were completed prior to the introduction of applicable environmental assessment laws (starting in the late 1960s). However, previous research and cultural resource studies of the surrounding area have been referenced. As described in more detail below, this CIA report satisfies the state Office of Environmental Quality Control’s (OEQC) guidelines for assessing cultural impacts; and is designed to provide stakeholders with sufficient information to help them preserve and perpetuate significant cultural resources and practices in a way that is both authentic and practical. This document is a synthesis of previously obtained information, new interviews of knowledgeable individuals, and details of the proposed project. The analysis of these data sets ultimately forms the basis for the assessment of cultural impacts, which will help facilitate project planning and mitigation of adverse impacts to cultural resources and practices.

Purpose and Content of Cultural Impact Assessments

This CIA is designed to satisfy HRS § 343 (law governing Environmental Impact Statements [EIS]) and HAR § 11-200 (rules governing content of EIS and Environmental Assessment [EA] documents) as well as the OEQC’s 2012 Guide to the Implementation and Practice of the Hawaii Environmental Policy Act (see Appendix A for a relevant excerpt). Interestingly, cultural resources valued by individuals and communities with historical and genealogical ties to a given project area may be different than those deemed significant by “outsiders,” including scientists, anthropologists, and other researchers not from the area.[2] Likewise, the same resource may be valued in different ways by “insiders” and “outsiders.” A pertinent example in this study is the discovery of buried pond sediments—likely lo‘i kalo (irrigated taro)—in portions of the project area during recent archaeological work (cf. Monahan 2017); this discovery may be valued primarily by community members as evidence of the project area’s original fertility and abundance, but by archaeologists as an opportunity to conduct additional scientific analyses of these unique soils. In CIA work, we are interested in both of these perspectives. Our objectives are to identify *all* the various types of cultural resources in and near the project area, to explain why they are important to different individuals or groups, and to recommend ways they can be preserved or protected, if appropriate. We are also interested in expressing the intangible values people attribute to the project area. Maly and Maly (2005), citing Kent et al. (1995), use the term “cultural attachment” to describe this important class of phenomenon:

[1] Hawaiian words are not italicized since ‘Ōlelo Hawai‘i is an official state language rather than a “foreign” language. Likewise, we do not systematically define Hawaiian words, especially those in common use, unless they are germane to our discussion or interpretation of cultural resources (see Pukui and Elbert 1986 or http://wehewehe.org/ for Hawaiian dictionaries)

[2] Anthropologists have long recognized the value in studying both “insider” and “outsider” perspectives, called “emic” and “etic,” respectively, when trying to understand cultural values and significance.

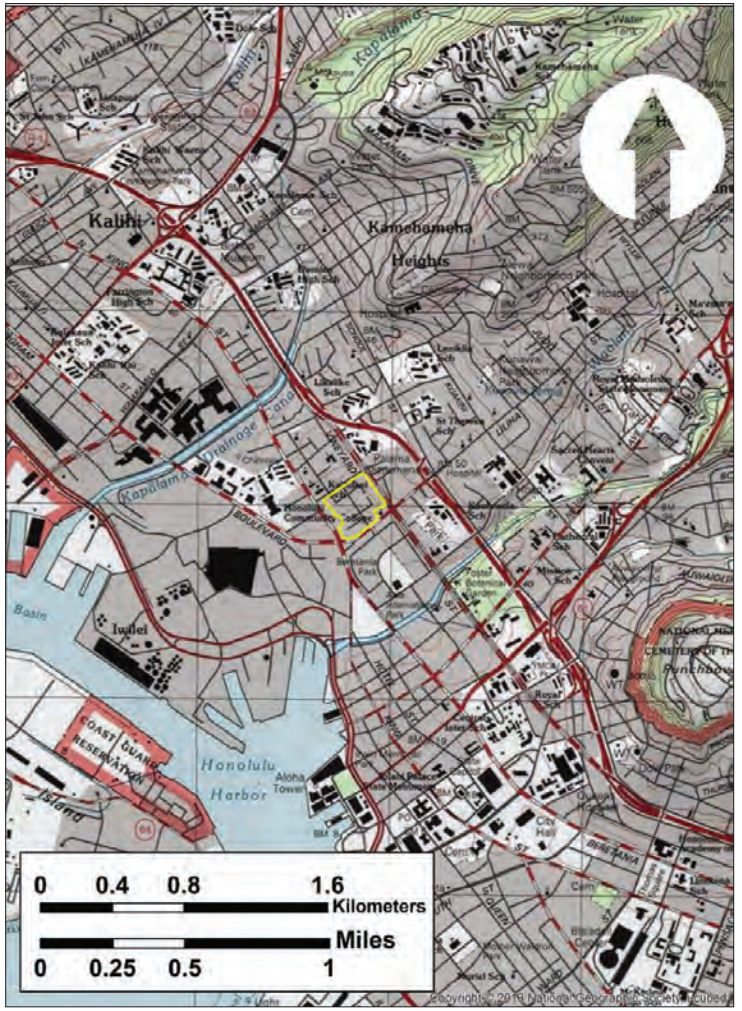

Figure 1. Project area (yellow outline) depicted on a USGS topographic map (base map source: ESRI’s ArcMap 10.2.2)

Figure 2. Project area (yellow outline) depicted on an aerial photograph

Figure 3. TMK map of project area and other parcels in same block (source: TMK data State GIS layer)

> "Cultural Attachment" embodies the tangible and intangible values of a culture—how a people identify with, and personify the environment around them. It is the intimate relationship (developed over generations of experiences) that people of a particular culture feel for the sites, features, phenomena, and natural resources etc., that surround them—their sense of place. This attachment is deeply rooted in the beliefs, practices, cultural evolution, and identity of a people. The significance of cultural attachment in a given culture is often overlooked by others whose beliefs and values evolved under a different set of circumstances. (Maly and Maly 2005:3)

In Hawai'i, commonly identified cultural resources include archaeological sites; burial sites and cemeteries; wahi pana (legendary places associated with oral history); natural landscape features[3] such as pu'u (e.g., hills, outcrops and other promontories), ridges, and water sources and courses; natural phenomena such as characteristic weather patterns, winds and rain (many of which have place-specific names); and other place names and landscape features that are important to local families. Such resources need not necessarily refer to Hawaiian culture but may also include other ethnic groups.

As described further in the document (see Methods), we also conducted extensive community outreach and consultation with numerous individuals and agencies, including Native Hawaiian organizations. The consultation objectives were (1) to provide notification that this project could affect cultural resources of interest to the community; (2) to seek consulted party views on the methods by which we identified and evaluated cultural resources in the project area; and (3) to solicit consulted party views on the proposed undertaking's potential effects on these things.

[3] In Hawaiian culture, there is no hard and fast distinction between cultural and natural resources; thus, for example, a clean and healthy kahawai (stream) is just as much a cultural resource—because its existence is crucial to carrying out traditional and customary practices such as irrigated (pond-field) agriculture—as a natural one.

Summary of the Proposed Undertaking

Mayor Wright Homes—a public housing complex built by the HPHA—were first occupied in 1952 or 1953 (depending on the source), making them approximately 64 or 65 years old. The proposed undertaking will replace the existing 364 residential units—currently consisting of 35 separate, low-rise buildings (plus an administration building)—with an entirely new mixed-use, mixed-income development comprised of up to 2,500 residential units and up to 80,000 square feet of commercial uses (note, when we started this CIA, the number of new residential units was originally described as 1,000 to 1,500, but this was recently changed to 2,500). The new development will include low, medium and high-rise buildings. This project is considered to be part of the Transit-Oriented Development (TOD) associated with construction of the Honolulu rail transit project.

Project Area Description

The project area block, bounded by N. King St., Liliha St., Vineyard Boulevard and Pua Lane, is fully urbanized with no naturally-occurring plants or animals, no natural streams, drainages or waterways, and minimal topographic variation other than a gentle slope down to the makai (seaward) direction. Elevation varies from approximately 25 ft. (7.6 m) above mean sea level (amsl) along Vineyard Boulevard to 10 ft. (3.0 m) amsl along N. King Street. About half of the project area is covered by asphalt, concrete and above-ground structures, while the rest consists of open grass and minimal landscaping (Figure 4). Mean annual rainfall in this part of O‘ahu is approximately 30 inches (762 mm) (Giambelluca et al. 2013). The project area is subject to a leeward-type of climate with winter (so-called Kona) rains predominating, and very light trade-wind rains coming down from Nu‘uanu Valley. According to the U.S. Department of Agriculture’s classification system, natural soils in the project area consist exclusively of Ewa silty clay loam (EmA), which occur on moderately sloping (0-2°) slopes (Foote et al. 1972). This natural soil is the result of admixture of decomposing basalt bedrock (parent material), downslope (colluvial) deposition, and alluvial deposition from the Nu‘uanu Stream, now (in its channelized configuration) about 500 m to the east. Before it was urbanized, the project area would have been periodically subject to flooding and overbank sedimentary deposition from the Nu‘uanu/Waolani stream system. During archaeological work, we also discovered a relatively shallow, lithified coral-reef bedrock in several trenches along the southwest side of the project area; we believe this represents the remnants of a once-elevated lithified reef—probably a late Pleistocene formation from the Waimānalo Sea Stand—as depicted on an 1817 historic map by Otto von Kotzebue (see Figure 5, below).

Figure 4. Representative view of project area during archaeological trenching, showing typical grassy areas, sidewalks in background, overhead electrical utilities and residential two- to three-story buildings

METHODS

This section describes the methods of archival research, consultation, interviews, and post-fieldwork activities for this project.

Archival Research

Some information in this report is based on recent archaeological and cultural-resource studies of the immediate area, including Belluomini et al. (2016), Maly et al. (2013), and Hammatt (2013). We also conducted multiple record searches at SHPD’s library in Kapolei; and utilized these on-line databases to obtain cultural, historical and archaeological data:

- OHA’s Papakilo database (http://papakilodatabase.com/main/main.php)
- OHA’s Kipuka database (http://kipukadatabase.com/kipuka/)
- Bernice P. Bishop Museum archaeological site database (http://has.bishopmuseum.org/index.asp)
- Bishop’s Hawaii Ethnological Notes (http://data.bishopmuseum.org/HEN/browse.php?stype=3)
- University of Hawai‘i-Mānoa’s digital maps (http://magis.manoa.hawaii.edu/maps/index.html)
- DAGS’ State Land Survey (http://ags.hawaii.gov/survey/map-search/)
- Waihona ‘Aina website (www.waihona.com)
- Digital newspaper archive “Chronicling America, Historic American Newspapers” (http://chroniclingamerica.loc.gov/lccn/sn82014681/)
- US Library of Congress digital maps (https://www.loc.gov/maps/)
- Hawai‘i State Archives digital collections (http://archives1.dags.hawaii.gov/)

PBR Hawai‘i & Associates staff also brought to our attention, and provided a copy of, a relevant, peer-review article by Kam (2013) that we cite in the historic period background review section of this report. Matt McDermott (Cultural Surveys Hawai‘i) provided assistance with links to reports by Maly et al. (2013). Kimi Matsushida (Lead Archaeologist, O‘ahu Island, SHDP) provided a link to Belluomini et al. (2016).

Consultation

From the end of May to early June, 2016, we sent formal consultation letters (Appendix B) regarding our proposed Cultural Impact Assessment (CIA) to the following agencies and individuals:

1. SHPD/DLNR (Administrator Downer, Archaeology Branch Chief Susan Lebo, O‘ahu Burial Site Program staff Regina Hilo, and Ka‘āhiki Solis);
2. OHA (Ka Pouhana/CEO Crabbe and staff in Compliance, Kai Markell and Lauren Morawski);
3. Kalihi-Palama Neighborhood Board (Chair Ryan Mandado);
4. Kalihi-Palama Hawaiian Civic Club (Pelekikena/President Leimomi Khan);
5. Cynthia Yoshida (Public Housing Supervisor, MWH);
6. Historic Hawaii Foundation (Kirsten Faulkner);
7. Ka‘anohi Paulette Kaleikini (Native Hawaiian, cultural descendant, Honolulu area);
8. Michael Lee (Native Hawaiian, cultural descendant, Honolulu area).

We provided the O‘ahu Island Burial Council in June, 2016, with an informational presentation about our proposed project. Emily Davids from MWH Partners, LLC, attended with Chris Monahan.

Ka‘anohi Kaleikini and Chris Monahan exchanged emails in May-June, 2016, regarding her consultation input. Her primary input was to bring our attention to the nearby, recent AIS by Cultural Surveys Hawai‘i (i.e., Belluomini et al. 2016); and to raise the issue of including cultural monitoring in our archaeological project.

OHA replied in writing on June 28, 2016, to our formal consultation letter to them (see Appendix B). OHA had nothing specific to communicate to us. Chris Monahan also communicated briefly by phone in June, 2016, with OHA Compliance staff, Kai Markell and Lauren Morawski.

Chris Monahan met formally with Susan Lebo, in June, 2016, about our proposed AIS. She suggested we reach out to SHPD staff, Kaʻāhiki Solis, History and Culture Branch, regarding information about the MWH property. We emailed Kaʻāhiki Solis on June 3, 2016, and again in September, 2016. She then provided some substantive input about the CIA we are preparing.

Interviews

We attempted to set up formal interviews with many people, and only two agreed to be interviewed. HPHA has a full accounting of our efforts to reach out to people to be interviewed, but we do not wish to publicize those who were not interested, because they have their own reasons and may not wish to singled out. Those who we reached out to but were unable to arrange interviews with include: at least six current, long-time residents of Mayor Wright Homes, a prominent academic/historian with knowledge of the project area, and people associated with the Oʻahu Island Burial Council.

In order to confirm the accuracy of the information shared by the interviewees, TCP Hawaiʻi provided written copies of the draft CIA and interview transcriptions and allows the interviewees to have full editorial control of the information they provided. The interview material that appears in this CIA was edited, revised and approved by the interviewees.

Post-fieldwork Activities

Archaeological GIS maps in this report were prepared by Todd Tulchin using ESRI software. Adobe Illustrator and ESRI's ArcMap 10.2.2 were also used to georeferenced the many historic maps presented in this report.

CULTURAL AND HISTORICAL CONTEXT

This section includes a synthesis of relevant cultural and historical information related to the types of land uses in the project area from pre-Contact, traditional Hawaiian times into the historic period, right up to construction of the Mayor Wright Homes around 1952.

Hawaiian Cultural Landscape

Ahupuaʻa boundaries can be extremely variable; and, depending on which source one cites, or what time period is referenced, the answer to which ahupuaʻa the Mayor Wright Homes is in varies. Honolulu Ahupuaʻa is an atypical example that has more to do with the political history of the nineteenth century—starting with the development of Honolulu harbor as a shipping port for Euro-American merchants in the first few decades of the 1800s—than with traditional Hawaiian settlement or subsistence patterns (Beechert 1991; Daws 2006). For example, the Hawaiʻi state GIS layer considers Nuʻuanu Valley and Stream (including the project area) as part of the large ahupuaʻa of Honolulu. Under this configuration, there is no Nuʻuanu Ahupuaʻa, which almost certainly does not reflect how pre-Contact Hawaiians viewed this landscape. On the other hand, recent USGS topographic maps show Nuʻuanu Ahupuaʻa coming down from the mountains but stopping at School Street. The well-known Bishop Museum compendium of archaeological sites and wahi pana (legendary places) *Sites of Oahu* (Sterling and Summers 1978) shows a similar configuration to the USGS version. Finally, Snakenberg's (1990) well-known "pre-Mahele" configuration of ahupuaʻa does not include Nuʻuanu (which is subsumed under Honolulu). As documented below, many historical accounts from the nineteenth century refer to the area as Pālama or Kapālama.

As described below, referring to the many middle nineteenth-century Land Commission Awards in the Mayor Wright Homes project area, Hawaiians consistently referred to their land as being in the ʻāina of Honolulu (also known traditionally as Kou). We believe the original inhabitants of Oʻahu—prior to the invasions by Kahekili (Maui) starting in the late eighteenth century, and later by Kamehameha (Hawaiʻi)—would have referred to the project area environs as Nuʻuanu Ahupuaʻa, given its location in the flood plain of this stream; and they would have considered the start of Pālama or Kapālama to be just a bit west of the current project area.

Figure 5 is a portion of an 1817 map of Honolulu Harbor and environs by Otto von Kotzebue (Fitzpatrick 1986:48-9) with the georeferenced project area. Beyond its general depiction of the early historic-period cultural landscape of Honolulu (e.g., showing a shoreline fishpond near the mouth of the Nuʻuanu Stream), this map is directly relevant to our study for several reasons. First, it shows the project area was in a dense cluster of loʻi kalo (irrigated taro)—these are the numerous rectangles arrayed in a grid pattern. Second, it shows several house sites (smaller, triangular symbols) scattered around the west side and east side of the loʻi kalo; and on top of what appears to be an elevated puʻu of some kind in the southern portion of the current project area. Third, and very specific to our excavation results, *the trenches we dug in this apparently elevated (southwestern) portion of the landscape contain shallow lithified coral-reef bedrock. We believe the elevated puʻu landform in Kotzebue's map is a bit of raised coral shelf that was eventually leveled or graded down.* It is likely this landscape feature is a late Pleistocene formation representing the well-documented Waimānalo Sea Stand dating to approximately 120,000 years before present, an interglacial period when sea levels in Hawaiʻi were some 7.5 m (24.8 ft.) above current levels (Macdonald et al. 1983; Ziegler 2002).

Figure 6 is a small portion of an 1825 map of Oahuʻs south shore by Charles Malden (Fitzpatrick 1986:62-3). This map does not include any details of the landscape in the project area environs, so we have not bothered to specifically call out the exact boundaries of the project area. It does show the addition of a wall—presumably a seawall—just makai of the project area, indicating perhaps the earliest map evidence of the start of landfilling activities in what would become Iwilei. Discussions by Daws (2006) and Fitzpatrick (1986) suggest this structural feature may have been part of an early effort to

Figure 5. Portion of 1817 map of Honolulu Harbor and environs by Otto von Kotzebue (Fitzpatrick 1986:48-9) with approximate location of project area in red outline in the heart of the Nu'uanu flood plain

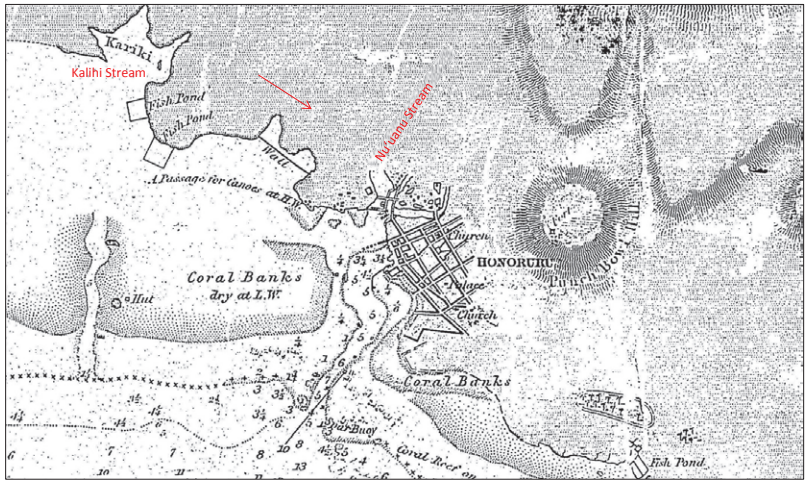

Figure 6. Portion of 1825 map of Oahu's south shore by Charles Malden (Fitzpatrick 1986:62-3) with approximate location of project area indicated by arrow

prevent the Honolulu harbor from silting up and becoming too shallow for shipping due to the muddy delta at the mouth of Nu‘uanu Stream.

Mid Nineteenth-Century Developments in and near the Project Area

Figure 7, a portion of 1855 map by J.M.H. de La Passe (Fitzpatrick 1986:82-3), shows the georeferenced project area in a dense cluster of lo‘i kalo (taro ponds) with scattered house sites here and there. Several fishponds—including Kuwila and Kawa—are located along the shoreline. By this time (1855), Honolulu had changed greatly from its traditional (pre-Contact) condition and character, when it was not yet a major chiefly settlement (Waikīkī enjoyed that status before the turn of the nineteenth century), and even from its early days as a growing harbor town, when Kamehameha the Great was still alive.

By mid-century, the main town of Honolulu was still on the other side of Nu‘uanu town (in what would become known as Chinatown). La Passe’s map does show an old alignment of King Street passing just south of the project area. This map does not show Liliha Street, which borders the project area on its southeast side, but Daws (2006:268–9), citing several contemporary accounts from newspapers in the 1850s and 1860s, has this to say about the original Liliha Street:

> For years after its formal designation, Liliha Street, to the west of Nu‘uanu stream, was interrupted in several places by the raised banks and swampy depressions of kalo patches. This was only one picturesque street nuisance among many in the environs of Honolulu.

Table 1 is a summary of Land Commission Awards in and immediately adjacent to the project area. These data reveal many relevant observations. First, in such a relatively small area—a modern city block—there are at least five named ‘ili: Kapahaha, Kahawali (or Kahawale), Koiuiu (also “Koiuiu, Leleo”), Hauhaukoi and Keoneula. Immediately adjacent ‘ili include Aala, Kapalama and Kaoaowai. Second, among the names of Hawaiians who were awarded parcels in the project area, there is one Julia (or Juliana) Alapa‘i Kauwa (or Kauwa‘a), an Ali‘i Nui (high chiefess), sometimes referred to as Princess, who was married to the famous John Young. She died in 1849, and was awarded many other lands, including others on O‘ahu (including ‘Ewa) as well as Maui and Moloka‘i. She is described as the konohiki (overseer or land manager) by some claimants. The table also shows that, when available, land use always includes lo‘i kalo, with several house sites, and occasional mention of ‘auwai. One person (Kahina) claims a “lo‘i iloko,” which is a term for a pond-field kalo patch also used as a small fishpond.

Figure 8 is a graphic depiction of kuleana parcels (Land Commission Awards), Land Grants—where people purchased the land from the government (and for which there is generally less publicly available information on land use), and Land Court Applications, which generally represent some kind of quiet title actions taken after the Mahele to obtain kuleana parcels. The three Land Grants, 2063, 2065 and 2346, to Panio, Napehe and Kaona, respectively, were purchased in 1856–7.

Figure 9 and Figure 10 are representative survey maps of two kuleana parcels in the project area (LCAw 1405 to Pihiliili and 8613 to Keonekapu) from 1854–5. While both of these maps are fairly rudimentary survey depictions—typical of the Mahele documentation, they each show ‘auwai entering the properties from the upslope (mauka) side.

Newspaper accounts from shortly after this period indicate a lot of interest in buying and selling these parcels. For example, in an 1873 edition of *The Pacific Commercial Advertiser*, there is an advertisement to sell “4 Kalo Patches” at “Kapahaha, Liliha St.” From the same newspaper, in 1881, one Mrs. Kaaea Akepo wishes to sell “…that valuable piece of land, with buildings thereon, situated at Kapahaha, Kapalama-Kai, known as ‘THE OLD KING STREET LAUNDRY HOUSE.’”

Figure 11, a portion of an 1878 map showing an early depiction of Liliha Street (southeast side of project area) and King Street, also shows the OR&L railroad line south of the project area just mauka (inland) of the prison, and a couple house sites in the project area.

Figure 7. Portion of 1855 map showing Honolulu Harbor and environs by J.M.H. de La Passe (Fitzpatrick 1986:82-3) with approximate location of project area in dense cluster of lo‘i kalo (taro ponds)

Table 1. Summary of Land Commission Awards in and near the Mayor Wright Homes Project Area

LCAw ('āpana)	Acres	Land Use	RP	Name	'Ili	Location Relative to Project Area (PA)	Comments
2072:2	0.30 ac.	2 lo'i kalo & 1 garden house	5572	Kapaalua	Kapahaha	Adjacent to PA (outside PA) between it & King St.	RP 5572 dates to 1864 and includes 3 'āpana in all under LCAw 2072 (2.15 acres in total)
2072:3	0.25 ac.	1 lo'i				*Partially in PA along King St. side (mostly out of PA to King St. side)*	
8525-B:1	1.74 ac.	?	8185	J.A. (Julia Alapa'i) Kauwa (w)	Kapahaha	*Partially in PA at W corner (partially out of PA)*	This appears to be Ali'i (High Chiefess) Julia (or Juliana) Alapa'i Kauwa, or Kauwa'a (born c. 1814, died 1849), described as the Konohiki by some; RP 8185 dates to 1906, and instead of using the term 'āpana, says "part"; she received (and relinquished) many land awards; she received awards in Kona (O'ahu) and 'Ewa, as well as Maui and Moloka'i.
1285:4	1.24 ac.	2 lo'i	1982	Kaluau or Kaluau , W. (w)	Kahawali	*Partially in PA at W corner (partially out of PA)*	Indices of Awards (1929) indicate she received 4 'āpana under LCAw 1285 w. 'ili listed as Kauwai (Kauaowai), Kapahaha & Kahawali (Kahawali o Kaeo); Waihona 'Aina listed the 'ili as "Kapahaha & Kahawali"; claims (NR) she received a house lot from Kapaahua at the time of Kinau; calls J.P. Alapa'i the Konohiki
1405:1 (por.)	1.90 ac. (total)	8 lo'i & 1 house site (total)	5553 (por.)	Pihiliili	Kahawali	**Completely in PA**	This LCAw also associated with RP 2397 ('ili also spelled Kahawale in some documents); 'āpana 1 seems to have been partially taken (or sold?) during LCAp 1192
1405:1 (por.)						**Completely in PA**	
1405:4						**Completely in PA**	
933:1	1.05 ac. (total)	3 lo'i & 1 house site	1226	Kamae	Koiuiu	Adjacent to PA (out of PA) south of Desha Lane	Incorrectly spelled Kiouiu in Indices of Awards (1929); he was awarded 4 'āpana in all under this LCAw
933:2						**Completely in PA**	
933:3						*Partially in PA at NE corner (partially out of PA)*	
1078*	0.62 ac.	3 lo'i kalo & 1 "small hut"	4393	Naili or Naihe*	Kahawali	**Completely in PA**	* Naili (or Naihe) for Kanui (cf. Indices of Awards 1929); this 'āpana identified as "loi" on Pihiliili's survey map; Indices of Awards (1929) state: "Awarded by Privy Council by Resolution dated June 23, 1856"; received in Boki's time (i.e., probably 1820s); referred to as an 'ili 'āina
605:2	1.29	3 lo'i	4423	Kalunaaina for Lupe	Keoneula	**Completely in PA (along Pua Lane side)**	Kalunaaina received these lands from Kamehameha III in the time of Ka'ahumanu; he died in 1846 and gave lands to his only child (daughter named Lupe); this award had 6 'āpana; description of 'āpana 2 includes 'auwai
605:3	0.66	2 lo'i				**Completely in PA (along Pua Lane side)**	
6236	6 contiguous 'āpana; total 3.56 ac.	Multiple lo'i	See Comments	Kaaiawaawa	Koiuiu	**Completely in PA (in S corner)**	Unclear if all 6 'āpana are in the project area; there are 6 different Royal Patents: 7339, 8160, 8296, 8338, 8339 & 8342
36 F.L.	0.85 ac.	Lo'i	2248	Nakilaku (or Nakileku)	Aala	Adjacent to PA (outside of PA) near corner of Liliha & Vineyard	--
3 F.L.	0.57 ac.	4 lo'i	2684	Kapo	Hauhaukoi	Adjacent to PA (outside of PA) along Vineyard	In addition to 4 lo'i, "loi maloo" (dried up or not-in-use) lo'i are also mentioned in NT; received in 1839 from (or at the time of) Kinau
2 F.L.	0.67 ac.	5 lo'i & 1 house site	2102	Kamoku	Hauhaukoi	*Partially in PA along Vineyard (partially out of PA)*	Received land from (or at time of) Kinau circa 1839; house site called a "kahuhale"
8520:1	?	?	8197 (por.)	Kaeo, Iosua	Kahawali, Kapalama	**Completely in PA**	Claimant received several 'āpana in different places—even different islands—under same LCAw 8520; e.g., 'āpana 4 is on Lāna'i; 'āpana 2 & 3 are on Maui; 'āpana 5 is Hilo, and so on
8520:1	?	?	8197 (por.)			*Partially in PA along Vineyard (partially out of PA)*	
8520:1	?	?	8293			Adjacent to PA (outside of PA) at N corner	
2107:1	0.37 ac.	2 lo'i iloko (taro/fishpond)	4528	Kahina	Kahawali	**Completely in PA**	Claimant received 3 other, nearby 'āpana under a different Royal Patent (7254)
2107:2	0.42 ac.	Lo'i				*Partially in PA along Vineyard (partially out of PA)*	
640	0.63 ac.	4 lo'i & 1 house	8239	Kamahalo	Hauhaukoi	Adjacent to PA (outside of PA) along Pua Lane	Called "Land Patent" rather than Royal Patent; received in time of Kinau
8613:2	1.40 ac.	6 lo'i	7446	Keonekapu, J.	Hauhaukoi	**Completely in PA**	'Auwai entering from mauka land
25 F.L.	0.37 ac.	3 lo'i	4518	Kukui (w)	Hauhaukoi	**Completely in PA**	Just NE of Kukui St. extension; Kukui was a woman (wahine); received in 1843
4747:2	0.98 ac.	7 lo'i	5610	Kama (w)	Leleo, Koiuiu	**Completely in PA**	'Āpana 1 located in Kapalama; Kama was a woman (wahine); received land from (or at time of) Kinau circa 1839
1362	0.46 ac.	2 lo'i	2681 (por.)	Naholowaa**	Keoneula	**Completely in PA**	** Naholowaa for Hoa (wahine), according to Indices of Awards 1929); FT says this Naholowaa had no claim to the land, he was only a "working man' under Hoa. "She told me to send in a claim for it as she was afraid she should not get her claim in before the Commission."

Abbreviations: LCAw = Land Commission Award; LCAp = Land Court Application; por. = portion; PA = Project area; RP = Royal Patent; NR = Native Register; NT = Native Testimony; FT = Foreign Testimony; w = wahine (woman).
Bold text = LCAw entirely within Project area; *italics = LCAw partially in/partially out of Project area;* plain text = immediately adjacent/abutting Project area

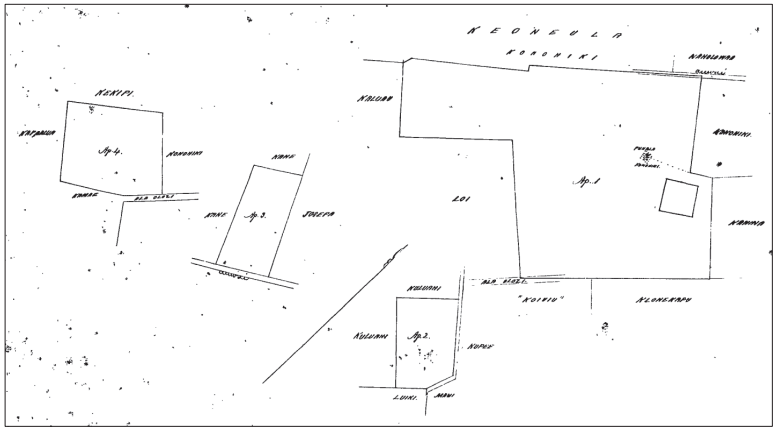

Figure 9. Survey map (circa 1854) from LCAw 1405 (to Pihiliilii) showing ‘auwai entering upper right corner of ‘āpana 1 (source: Papakilo database)

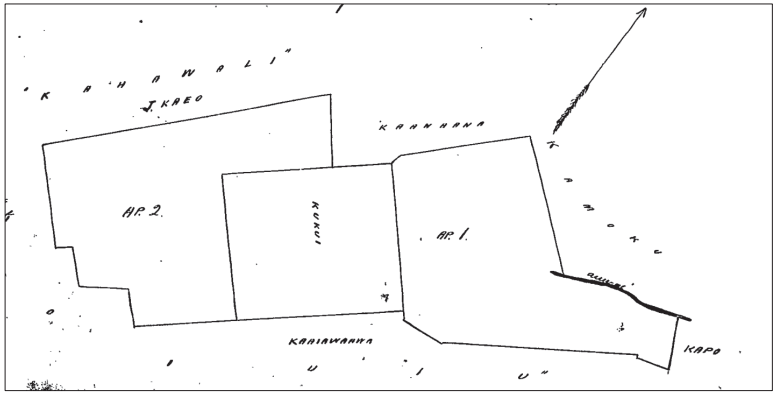

Figure 10. Survey map (circa 1853) from LCAw 8613 (to Keonekapu) showing ‘auwai entering from right of ‘āpana 1 (source: Papakilo database)

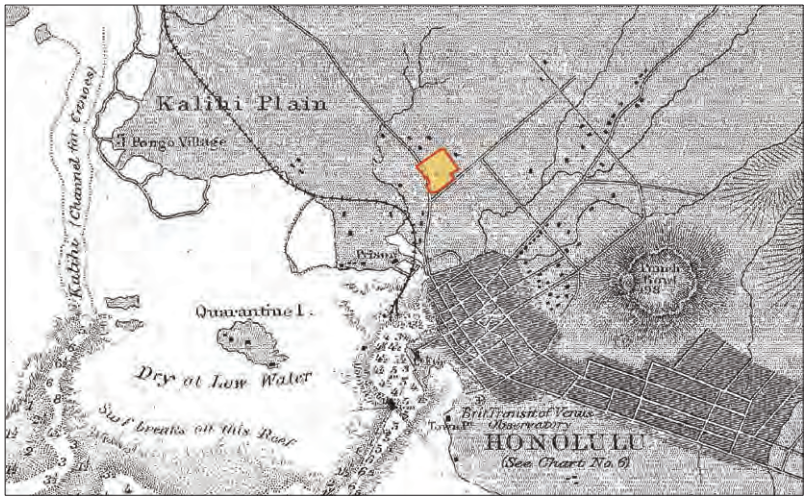

Figure 11. Portion of 1878 map (Registered Map 1505) showing Liliha Street (southeast side of project area) and an early alignment of King Street; note OR&L railroad line (source: DAGS Land Survey website)

Figure 12 is a portion of a draft map created between 1876–1881 by Lyons and Covington (working separately, not together) showing the project area and environs. As discussed by Moffat and Fitzpatrick (2004:40), there are some geospatial inaccuracies on this map, which makes georeferencing of the project area impossible. We have included this map because it shows some important cultural information and place names (e.g., an early depiction of Iwilei), as well as the Insane Asylum mauka of the project area.

Figure 13 is a portion of an 1887 map by Wall showing Liliha and King streets. *Note, the labelling of the large structure within the project area ("R. Keliikolani") is incorrect, and should read Queen Lili'uokalani*. An important wahi pana, Kunawai Spring, is depicted mauka of project area, just west of Liliha Street.

Figure 14 is a portion of an 1893 map by Wall showing many more cultural details than the previous (1887) version. The Queen's residential compound has been correctly labelled (Lili'uokalani) in this version; note, also, the extensive cross-hatching mauka of the project area and around Nu'uanu Stream that appears to depict lo'i kalo and/or other type/s of cultivated fields.

Figure 15, a portion of an 1897 map by Monsarrat, shows many Hawaiian place names, a new (not seen on other historic maps) pond mauka of School Street ("Waikahalulu"), and the advent of rice cultivation west and northwest of the project area.

The Royal Residences of Kapālama

As documented by the local historian, Ralph Thomas Kam, there were once large residential complexes belonging to Queen Lili'uokalani—in the western portion of the current project area—and Princess Ruth Ke'elikōlani—just west of Pua Lane, as late as the end of the nineteenth century (Kam 2013). Several historic maps reproduced below (see Figure 13 to Figure 15) show the location of the Queen's place. Princess Ruth's was just west of this (see caption to Figure 15).

As Kam (2013:147) points out, this area was once a kind of "suburb for the elite of Honolulu." Most of the details in his research article are beyond the scope of this CIA, but interested readers will find a wealth of historical information in his paper entitled *Remembering the Royal Residences of Kapālama: The Homes of Princess Ruth Ke'elikōlani and Queen Lili'uokalani.* Here, we focus on some highlights from the results of his research.

1. It is remarkable that there are no historical markers or signs whatsoever at the locations of these places, which belonged to two of the most powerful Hawaiian Ali'i Nui in the late period of the Hawaiian Kingdom. Likewise, there is no systematic photographic record of these places, whose characteristics Kam had to reconstruct using mostly contemporary newspaper and magazine accounts.
2. Princess Ruth's place was called Mauna Kalama, and it was bounded by Asylum Road (now called Pālama Street) on the northwest, King Street to the southwest and what is now Pua Lane. The current Kanoa Lane bisects the Mauna Kalama site. Princess Ruth only lived at this house for less than five years, as she passed away in 1883. By 1884, with the death of Bernice Pauahi Bishop, the property became part of the Bishop Estate-Kamehameha Schools holdings, and was put up for rent or lease. Kam relates interesting details of a prominent Hawaiian who rented this house, Joseph Kaho'oluhi Nāwahī, an attorney who opposed annexation by the United States. For example, "[a]s a key leader of the opposition, his Kapālama home was searched for weapons on the evening of Saturday, December 8, 1894" (ibid.:150)
3. After Nāwahī's death in 1896, the mansion was transformed into the Pālama Chinese School, a missionary boarding school (Seventh Day Adventist). After the school moved to another location by 1900, the Bishop Estate commenced subdividing the property in order to lease it out in portions. A major undertaking needed to accomplish this was the filling of agricultural wetlands that surrounded the residence; historical records described by Kam indicate it took more than 24,000 wheelbarrow loads of fill to complete this project (ibid.:153).
4. In 1885, the Queen (then still Princess) Lili'uokalani had a residential estate built within the boundaries of the current (CIA) project area called Mu'olaulani,[4] which Kam believes may have been named after Princess Ruth. She purchased the land "for $8,000 from a couple who had bought the property from the widow of Simon K. Ka'ai" (ibid.:158).
5. In addition to serving as a residence for Lili'uokalani and a place to entertain guests, Mu'olaulani was also used for meetings of the Liliuokalani Educational Society, "whose aim was 'the care and education of needy orphan children'" (ibid.:161). King David Kalākaua made a special presentation at Mu'olaulani in honor of his sister's 48th birthday. Other famous people (e.g., Robert Wilcox) and occasions were also marked at this residence.
6. In 1889, Lili'uokalani returned to live with her husband, John Owen Dominis, at Washington Place. At the time of the ill-fated rebellion led by Wilcox, in 1889, he was staying at Mu'olaulani, and Lili'uokalani was guilty by association. Her house was used over the years by those resisting the U.S. take over. After she was jailed in January, 1895, the house was leased out to British Commissioner and Consul-General, Albert George Sidney Hawes.
7. By 1901, Mu'olaulani was leased out and being used as a Japanese hotel. By 1906, Mu'olaulani was "divided into fourteen separate residences and labeled as a tenement" (ibid.:169). As Kam points out, this term (tenement) does not imply it was a slum, rather, it was used to refer to properties rented out to multiple families. The 1906 Dakin map (see Figure 17, below; see also Kam 2013:170) shows what the outline of Mu'olaulani looked like after it was subdivided into tenements. Numerous lessees rented the property over the next several years. After Lili'uokalani's death in 1917, the original structures at Mu'olaulani continued to be altered and partially razed. Even the remnant portion of surviving Mu'olaulani that can be seen at late as the early 1950s (on a Sanborn map) was gone by the time Mayor Wright Homes was complete in 1953.

[4] Pukui et al. (1974) translate this as "innumerable royal buds."

Figure 12. Portion of draft 1876-1881 map (Lyons/Covington) showing project area environs; there are some geospatial inaccuracies on this map, which makes georeferencing of project area impossible (see arrow for approximate location); this map shows some important cultural information and place names, which is why it is reproduced here (see Moffat and Fitzpatrick 2004:40) (source: U.S. Library of Congress website)

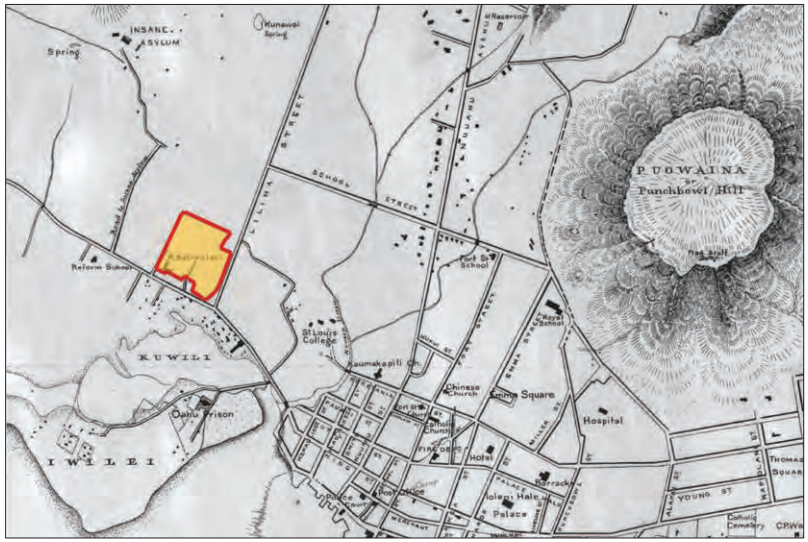

Figure 13. Portion of 1887 (Wall) map showing Liliha St. and King St.; *labelling of structure within project area ("R. Keliikolani") is incorrect, and should read Queen Lili'uokalani*; note location of Kunawai Spring mauka of project area (source: U.S. Library of Congress website)

Figure 14. Portion of 1893 (Wall) map (Registered Map 1690) showing many more cultural details than the 1887 version (previous image); note that the Queen's house (Liliʻuokalani) has been correctly labelled in this version; note, too, the cross-hatching mauka of the project area and around Nuʻuanu Stream that depicts loʻi kalo and/or other type/s of cultivated fields (source: DAGS Land Survey website)

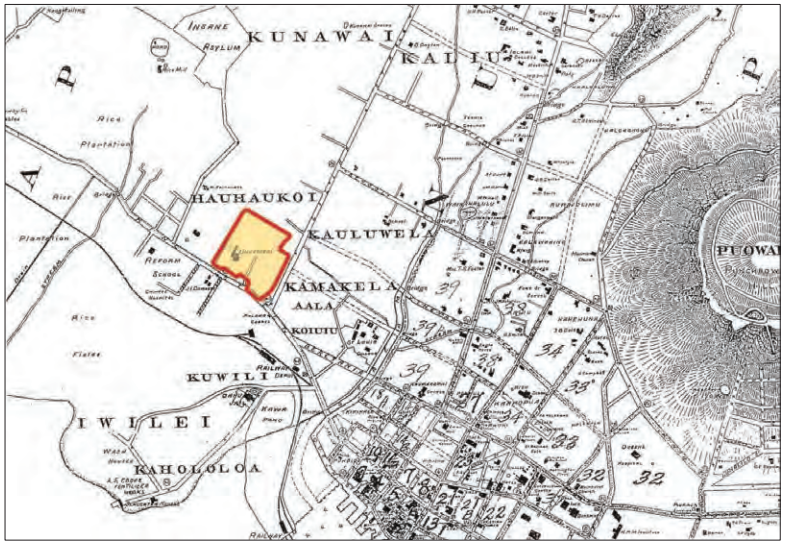

Figure 15. Portion of 1897 (Monsarrat) map (Registered Map 1910) showing many Hawaiian place names, a new (not seen on other historic maps) pond mauka of School St. ("Waikahalulu"), and the advent of rice cultivation west and northwest of the project area (source: UH-Mānoa MAGIS digital collections)

Early Twentieth-Century Developments in and near the Project Area

Figure 16, a portion of 1901 map by Monsarrat, shows early neighborhoods and blocks with Hawaiian place names and formalization of many streets. Note that Queen Lili'uokalani's place is no longer depicted in the project area on this map. Newspaper articles in the *The Pacific Commercial Advertiser* from 1902 list many building permits for 1- and 2-story wooden structures. In 1900, the *Evening Bulletin* listed many building permits for wooden structures for Chinese names near Pua Lane and King Street.

A series of 1906 fire insurance maps prepared by Dakin, stitched together into Figure 17, shows the first detailed view of what specific types of structures were built in the project area. By this time, it contained many residential ("tenements"), commercial and light industrial structures, including a large soy factory (Hawaiian Soy Co., Ltd.) along Pua Lane, a small church (Palama Christian Church), laundries, a Japanese hotel, and small "factories" (to make candy and mattresses) along Liliha, as well as horse stables. "Market gardens" and remnants of the taro fields were also present in the mauka portions of the site.

A sampling of 1906 real estate transactions listed in *The Pacific Commercial Advertiser,* however, continues to highlight the importance of agriculture in the project area: "10 taro patches" at Kapahaha sold for $2,250, and another (same description) for $3,250. A 1907 listing in the *Hawaii Star* listed sale of a piece of land within the project area (LCA 1405:4, RP 5553 originally to Pihiliilii) for $400 from Caroline K. Silva and husband to Emmeluth Trust.

Contemporary accounts from this time period illustrate the growing pains of an urban setting in development, with a letter to the editor in 1909 (in *The Pacific Commercial Advertiser*) complaining about pot holes on Pua Lane, unsanitary conditions and possible typhoid (1905, *The Pacific Commercial Advertiser* and *Evening Bulletin*) at Pua and Desha lanes, and the need for sewer pipe installation in this area (1908, *The Pacific Commercial Advertiser*).

Figure 18, a portion of 1909 survey map from Land Court Application 170, shows several surrounding kuleana parcels (Land Commission Awards), and still depicts an 'auwai system entering from the mauka (upslope) side. The continuing importance of this area for agricultural purposes is highlighted by an earlier (1902) article in the *Evening Bulletin* (front page, September 1) of a man getting attacked by two other men and running to escape: "He managed to run away from his assailants by crossing the taro patches which lie between Liliha street and Asylum road."

Figure 19, a portion of 1912 map by Monsarrat, shows neighborhoods and blocks with Hawaiian place names and the formalization of streets and lanes within the project area, including the Kukui Street extension (which was never built, but turned into the central driveway of the Mayor Wright Homes.

Figure 20, a series of 1914 Sandborn fire insurance maps (stitched together), shows a reduction in the overall extent of cultivated garden areas. The previous (1906) location of the "Palama Christian Church" is now labelled "Auto Painting," and a new structure labelled "Moving Pictures" is located just west of this building. In 1916 advertisements in the *Honolulu Star-Bulletin,* people advertised their trades at Desha Lane as including a building/contractor (Miyamoto) and one (Tanabe) who offered massage and "bone setting." A 1917 article in the same paper describes ongoingtroubles with illegal liquor-making operations.

Figure 21, a portion of 1920 map by Monsarrat, shows neighborhoods and blocks with Hawaiian place names, and new ones just southeast of project area; note also an early (perhaps the first) depiction of the location of "Palama Settlement" south of King Street (before it eventually moved to its current location north of the project area).

Figure 16. Portion of 1901 (Monsarrat) map showing neighborhoods and blocks with Hawaiian place names and formalization of many streets; note, Queen Lili'uokalani's place is no longer depicted on this map (source: UH-Mānoa MAGIS digital collections)

Figure 17. Series of 1906 Dakin fire insurance maps (stitched together); Liliha Street at bottom of image, Pua Lane at top; note large area dedicated to taro and "market gardens"; see text for other details (source: UH-Mānoa MAGIS digital collections)

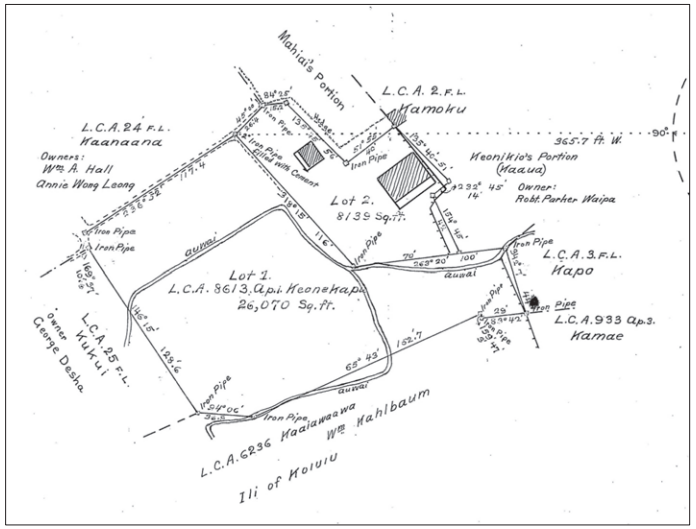

Figure 18. Portion of 1909 survey map from Land Court Application 170 showing several surrounding LCAw (kuleana parcels); note 'auwai system entering from mauka side; intersection of Liliha and Vineyard is just outside of the image to the lower right (source: DAGS Land Survey website)

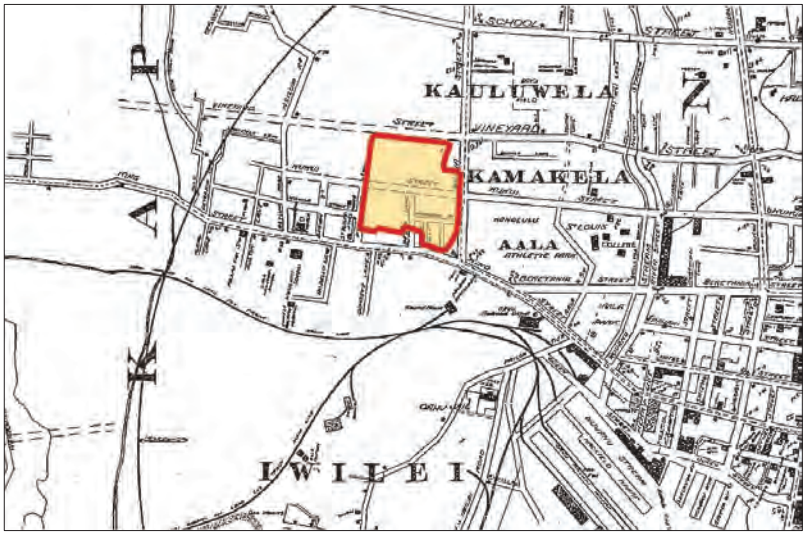

Figure 19. Portion of 1912 (Monsarrat) map showing neighborhoods and blocks with Hawaiian place names and formalization of streets within the project area (source: UH-Mānoa MAGIS digital collections)

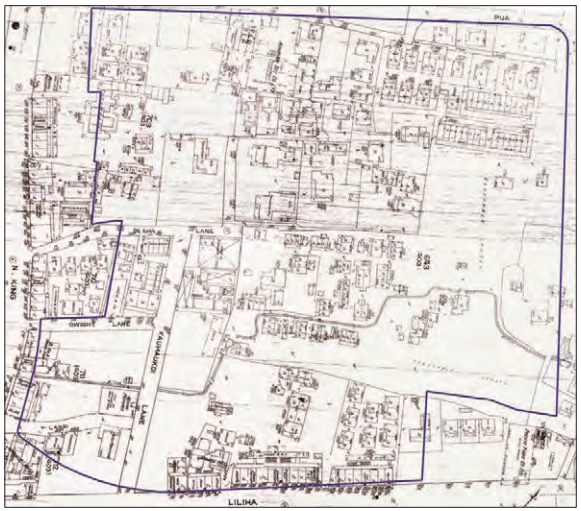

Figure 20. Series of 1914 Sandborn fire insurance maps (stitched together); Liliha Street at bottom of image, Pua Lane at top; note reduction in cultivated gardens area; see text for other details (source: UH-Mānoa MAGIS digital collections)

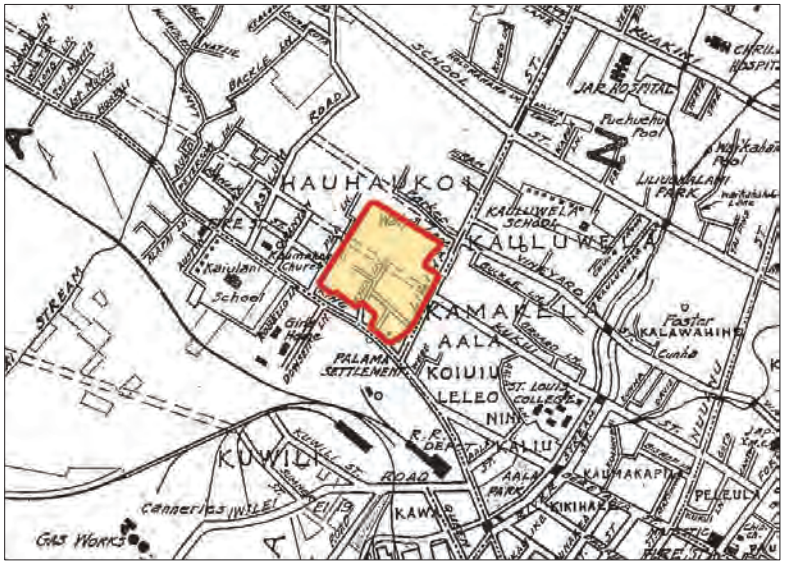

Figure 21. Portion of 1920 (Monsarrat) map showing neighborhoods and blocks with Hawaiian place names, and new ones just southeast of project area; note location of Pālama Settlement south of King St. (source: UH-Mānoa MAGIS digital collections)

Figure 22 is a portion of a 1920 Land Court Application 463 map showing several surrounding kuleana parcels (Land Commission Awards), and illustrating the continuing presence of an ‘auwai system and rectangular garden plots in portions of the current project area. By this time, it is likely that these gardens, were at least in part, growing commercial crops and not just subsistence foods.

Figure 23, a series of 1927 Sandborn fire insurance maps (stitched together), shows a substantial reduction in the amount of area devoted to cultivated gardens. By this time, apartment structures (tenements) had taken over nearly all of the project area with just a couple commercial operations remaining along Liliha and Pua Lane. A dance hall replaced the previous location of the auto painting structure, and a Filipino Missions and Social Club appeared in the corner parcel—just outside the project area, at the intersection of Liliha and Vineyard.

Figure 24, a comparison of 1927, 1933 and 1943 USGS topographic maps of the project area shows no changes in the project area during this time, which is not accurate. It also fails to depict most of the structures known to be in the project area based on the fire insurance maps. This is a cautionary lesson for interpreting such maps as indicting the lack of structure in maps of Honolulu at this (early to middle twentieth century) time.

Figure 25 is a 1939 map of site conditions. Along with Figure 26, a portion (detail) of a 1940 aerial photograph including the project area block about a decade prior to construction of Mayor Wright Homes, illustrates the continuing trend towards apartment buildings and residential structures.

Figure 27, a series of 1947 Sandborn fire insurance maps (stitched together), shows extensive razing (demoliton) of structures compared with 1927 maps, presumably in antipication of the Mayor Wright Homes development.

Figure 28 is a portion (detail) of a 1952 aerial photograph including the project area block during (in-progress) construction of Mayor Wright Homes.

Oral History Information from the Twentieth-Century in and near the Project Area

In the late 1990s, the University of Hawai'i-Mānoa's Center for Oral History (UH-COH) completed approximately 30 interviews with people who once lived or worked at Pālama Settlement (UH-COH 1998). Many of those interviewed had specific knowledge of Mayor Wright Homes and its immediate environs.

Pālama Settlement Oral History Interviews

Historical details of the founding and evolution of Pālama Settlement, as described in the University of Hawai'i's study (UH-COH 1998), offer some pertinent information regarding the current project area. We quote this study in some detail below, with annotations and comments added about the current project area. According to UH-COH (1998:Introduction page to interviews),

> On June 2, 1896, Honolulu philanthropist P.C. Jones built Palama Chapel at the corner of King and Liliha streets in Palama, O'ahu. . . Palama was home to mostly working-class Hawaiian families.

Note, the Dakin fire insurance map from 1906 reproduced as Figure 17 (above) shows a structure labeled "Palama Christian Church" in the lower left-hand corner at the intersection of King and Liliha. *Thus, the precursor to Pālama Settlement was actually located in the current project area.* Note also use of the term "Palama" (or sometimes Kapalama in other historical resources) to refer to this area. The quote continues:

> In 1900, as Honolulu health officials attempted to rid the nearby Chinatown area of bubonic plague, fire destroyed a four-block section [in Chinatown]. Displaced residents took up residence in newly built tenetments in Palama, changing the physical, social, and economic make-up of the community. (ibid.) [brackets added]
>
> After a territorywide fund-raising effort, Palama Settlement in 1925 moved to its present location [along the mauka side of Vineyard Boulevard, just mauka of the current project area] with nine buildings spread over eight acres of land. (ibid.)

It is interesting to note, as depicted in a 1920 map (see Figure 21, above), it appears that Pālama Settlement was once located in yet another, different place just makai (south) of King Street.

Of more direct relevance to the summaries of the people interviewed by UH-COH (1998), because these are the times in which they lived and have direct experiences and memories, World War II and the post-war years initiated "widespread changes in Hawai'i's social, economic, and political environment … [including] … the way social agencies such as Palama Settlement addressed community needs" (UH-COH 1998:Introduction page to interviews), in essence, moving away from a strictly place-based service provider to one that began to offers programs for a fee and that served people regardless of where they lived. Due to the civil rights and anti-poverty legislation of the 1960s and 70s, which brought in large amounts of federeal money, this time period was a kind of "golden age" for the services and activities offered by Pālama Settlement.

A total of 12 interviewees from UH-COH's (1998) project discused Mayor Wright Homes, as summarized below. Note, these are arranged alphabetically by last name.

Edward "Skippa" Diaz, born in Kalihi in 1944, is the third of seven children. He and his family moved into Mayor Wright Homes when it opened (around 1953). He spent lots of time at Pālama Settlement doing sports, including karate and swimming, as well as learning a muscial instrument. He did the camping and other club activities as well. After earning degrees (up to a Master's) at Oregon State Univeristy, playing professional football and teaching in Washington state, he returned to the islands in 1972. He has taught and coached in the public school system ever since, and most recently, has been the coach of Farrington's football team.

He started his interview by saying his was one of the first families that moved into the brand new Mayor Wright's (this phrase, "Mayor Wright's," is how many people refer to Mayor Wright Homes, and these terms are used interchangeably in this section) when it opened in 1953. He had fond memories of all the activities and programs that Pālama Settlement had to offer.

Skippa Diaz described himself as kind of a "kolohe" (rascal), and said Pālama Settlement staff helped guide him to be a better person. He also talked about life at Mayor Wright's:

> Well, it was just like it is right now. It's a tough row to hoe. There's a lot of harsh things going on in the community. Economically, (socially), the things we lack in those areas really make life—a lot of mistakes over and over and over. So you see that a lot. But you also see people grabbing themselves by the bootstraps like that Horatio Alger kind of stuff and then stepping out of there. In the span of their own lifetime. (UH-COH 1998:829)

Lorin T. Gill, born in Honolulu in 1928, was raised in Tantalus. After receiving his B.A. from the University of Hawai'i in 1951, he took more courses at the university in social work, eventually joining Pālama Settlement in 1953. He developed camping and hiking programs. He eventually rose to the level of director of Pālama Settlement.

He discussed at length the history of Samoans coming Mayor Wright Homes, and having to fulfill family and social obligations by letting many members of their extended families come and stay with them, even though it was against the rules.

Jennie Lee In, born on the Big Island, moved to the Kauluwela/Liliha area of O'ahu when she was seven or eight years old (after the death of her mother). She was the seventh of seven children. Her father was born in China. Her mother, also Chinese, was born in the islands. Jennie Lee In obtained a degree from the University of Hawai'i in vocational home economics. She also earned a Master's degree in New York. She worked for a few years at Pālama Settlement as a social worker.

When she left a position at the Red Cross to work at Pālama, she was relatively inexperienced, and in her job interview to work at Pālama, she was asked question like, "Are you afraid to walk into Mayor Wright [Homes] housing?" She answered honestly,

> And I said, "Maybe the first few times, I would have some qualms." But I said, "If I walk into a hospital room with 150 patients and I get somebody scream at me, 'Get the hell out of there,' I don't think that could be any worse than walking into someplace in Pālama." I said, "I'm a local girl. What can they do? They're not about to swallow me." Because by then, I had developed this kind of consciousness that most of the dangers are reflected by your fear or lack of fear in a situation. (When) you walk in confidently, knowing what you're doing is right, then (you) would be generally safe. (UH-COH 1998:323)

She shared about trying to involve families and kids from Mayor Wright's into various programs that Pālama Settlement had to offer.

Bertha Lee Nahoopii, born in Honolulu in 1931, grew up in Kapahulu, but after receving her degree from the University of Hawai'i, was hired in the middle 1950s as a recreation instructor and, later, athletic director, at Pālama Settlement. Later, she worked as a policewoman with the Honolulu Police Department.

She talked about how, even after she left Pālama Settlement to work for the police, that she continued to be involved with juveniles at both Pālama and Mayor Wright, even spending some of her own money "to take the kids sometimes, you know? Go out, take them out, have a lunch or dessert or something" (UH-COH 1998:70):

> Oh yeah, they're all from the Mayor Wright [Homes] housing and Pālama [Street] so … Lot of parents were on welfare, I think. So they didn't have too much, especially the kids who came from the Mayor Wright area. Parents were not working.

Janet Nakashima—the oldest of 10 children—was born in Honolulu in 1921, and raised in Pālama. After a career in social work, she retired in 1996. Starting in 1965, she worked with Mayor Wright Homes through a Pālama Settlement-sponsored community action progam. She "started as one of the community org[anization] staff members under Shungo Okubo's supervision, and set up office in (an apartment in) Mayor Wright [Homes]" (UH-COH 1998:23). She had very fond memories of working at Mayor Wrights:

> We worked closely with the director of the Mayor Wright housing project and his tenant relations advisor, (Mrs.) Irene Fujiwara, and we had a ball. We were given an apartment which the residents themselves named Hale Kōkua. The whole purpose was to give some of the local women from the Mayor Wright Homes a chance to be trained and serve as outreach workers, paraprofessionals. (Their mission was) to get to know their neighbors and their concerns. (ibid.)

She described training several staff to inform Mayor Wright's residents about resources at their disposal, educational and vocational classes and other opportunities, including sewing classes and the establishment of a small library. She discussed the way that her trained staff occupied buildings throughout the complex as a way of integrating and interacting with the residents:

> …the aides were assigned certain building (within the housing project), They would get to know the residents of (their assigned) building and talk to—you know, they would have coffee hours and have the men and women get together and *talk story,* and express (their) concerns. And out of that (emerged a meeting), one of the things that we felt real good about. (UH-COH 1998:24)
>
> Also, the management, I think, found that the residents began to feel less intimated by them. And instead of seeing (management) as adversaries, they began to feel okay about letting them know, "Hey, you know this isn't working right," or whatever. And so, we feel that the aides provided some real meaningful kind of services. (UH-COH 1998:25)

Janet Nakashima also shared her experiences of the different ethnic and cultural groups she worked with over the years at Mayor Wright Homes:

> When I first started, just before the war, and during the war years, I guess there was a good-sized Japanese, Oriental population in and around Pālama. You know, Desha Lane [which is surrounded by the current project area] and all that. Then by the time I came back from Pittsburg and went back to work after my first two children, Mayor Wright had come up [been built, in 1952-3] . . . And so we began having an influx of non-Orientals—Hawaiians, part-Hawaiians, Samoans. (ibid.)

Earlene Piko, born in California in 1931, was raised in Westwood, California. She earned a B.A. in microbiology and nursing from UCLA. She also earned a Master's degree and did work towards a doctorate in educational phychology. She came to Hawai'i in 1952, and worked innovative youth programs at Pālama Settlement. During these years, from 1963 to 1979, she lived at the settlement.

In response to a question from her interviewer, and as "the only Haole in a sixteen-block area," Earlene Piko said,

> I was never afraid. I never locked my door. Really never crossed my mind that there was anything to be afraid of. . . . Everybody knew me. They didn't know my name, but they knew what I was. I was this Haole—they called the white-haired biddy that lived down there. . . . If I had business in Mayor Wright [Homes] housing at a house, I went to it. Night, morning, any kind, and felt perfectly safe. (UH-COH 1998:792)

She also talked quite a bit about gangs and fighting between Mayor Wright's and other places, such as Kūhiō Park Terrace. She said that back in this time, from the middle 1960s through the 1970s, these fights

did not involve weapons, only fists: "the knives didn't come in until later: (ibid.). She said the fights were not about money—because no one had any—and they were not about drugs; rather, they were just about pride.

She talked about the arrival of the Samoans as a difficult time because, according to Earlene Piko, they all (or nearly all) came from Apia (in Western Samoa), and were not used to modern conveniences. So, they had difficulty assimilating with the locals, especially Hawaiians and part-Hawaiians.

She described the demographic changes of the area:

> . . . the ethnic makeup of the area had changed really radically between '64, '63 and when the first big bunch of Samoans came in in the late [19]60s, probably '67 or '66. In those few years, that's when you had this mass influx from Samoa, right? Mayor Wright, when I first got here, was predominantly Hawaiian, part-Hawaiian mixed, a lot of Puerto Rican, chop suey. Mostly all chop suey. The Japanese in the area lived Waipā Lane, down to Liliha, down by the Japanese[-language] school there . . . There were hardly any Koreans. Koreans were an unknown factor. Filipinos, they didn't live in housing. They lived in these planned groups . . . UH-COH 1998:795)

Robert H. Rath was born in 1915 at the original Pālama Settlement—just makai (south) of the current project area, and his father was the first director of Pālama Settlement. When he was young, his mother taught Sunday school and English to immigrant families there. For the first 15 years of his life, he lived on the grounds of Pālama Settlement, but the family moved out in 1929 when his father died. Robert stayed involved with Pālama Settlement over the years, serving as president of the board of trustees.

Robert Rath talked about how the place of his birth (the orignal Pālama Settlement) later became the Komatsuya Hotel (at the time of the interview it was a Burger King). He shared some historical knowledge: that the "genesis of Pālama Settlement was Pālama Chapel and a man named Mr. P.C. Jones who was president of C. Brewer and Company, and one of the founders of Bank of Hawai'i" (UH-COH 1998:90). He shared that this particular congregation, the Central Union Church, struggled around the turn of the century and into the early twentieth century because most of the area residents were Hawaiian and its clergy did not speak the language (ibid.).

Staying with historical information, Robert Rath spoke about the last Hawaiian queen's relationship to the current project area (UH-COH 1998:91):

> … Queen Lili'uokalani had a home in that area [west corner of the current project area]. She liked to go there because [of] the informality as compared to being in the ['Iolani] Palace. A number of her retainers and a number of the *ali'i,* Hawaiian *ali'i* lived in the area where they were near her.

He then made the interesting connection between the struggles of Central Union Church in getting established around the turn of the century and the proximity of the Queen's house:

> …the predominantly Hawaiian group would in their minds connect Central Union Church's leaders with the overthrow of Queen Lili'uokalani in 1893. So there was a reticence on the part of the adult population of Hawaiians to assimilate with the Central Union Church. (ibid.)

Robert Rath also discussed the great Chinatown fire in 1900 that directly contributed to the construction of dense tenement housing in and around the current project area (ibid.):

> … the bubonic plague hit Honolulu Harbor and the Honolulu area. And they purposely burned down, they thought, a small section of Chinatown where people who had the plague had been residing. The fire got out of hand and decimated, just burned up that whole area, what is now Chinatown all the way through to 'A'ala Park. And that meant that those people had to be—they were displaced. And in a hurry tenements went up from 'A'ala Park, Liliha Street on through to what is now Mayor Wright housing. And that made it less desirable for

> the Hawaiian families to live there. They had enough wherewithal so they moved out and it turned into a vastly different community . . . [m]ore of an immigrant community or, you might say, the less wealthy Hawiians and others. There still [was a] substantial share of Hawaiians but they were not the *ali'i* retainers, Queen Lili'uokalani type of Hawaiian in there.

He also talked about what the area and neighborhood looked like when he was young (he was born in 1915):

> Well, looking up Liliha Street from the [old location of Pālama] settlement [the southeast of the current project area], on the right-hand side we had three-story tenement buildings, walk-ups. And the left-hand side were stores on the lower floor. Typical neighborhood type of grocery—and so on—stores.
>
> Many of the homes that were there . . . were community living. Lots of people packed into that area because, remember, there was panic when so many homes and so many people were displaced [by the Chinatown fire of 1900] that things were thrown up (quickly) for people to live in. Get something built quickly and move 'em in. Most of them, lot of them, had common cooking facilities. They didn't have their own kitchens. Common bath facilities. And I can remember as a kid mostly Japanese kids that I grew up with, you'd see 'em with their little towel and basket with soap. They used their (community) bath houses. They didn't have bathing facilities at home. (UH-COH 1998:95)

Recollecting from his childhood home at Pālama Settlement, he remembered " . . . a stream running back of us which would be now through Mayor Wright [Homes]" . . . "[a]nd you have to remember that there were taro patches up above what would now be Vineyard Boulevard, and rice fields. Those were all rice fields and taro patches" (ibid.).

Robert Rath also shared about Pālama Settlement staff doing outreach programs into Mayor Wright Homes (as well as Ka'ahumanu housing) to educate its residents about public health and other initiatives.

John E. Sharp, born in Tennessee in 1938, moved to Hawai'i in the early 1960s. Around 1967, after working for a year at the Kalihi YMCA, he was hired as a youth worker/coach at Pālama Settlement, where he lived for the next nine years. He eventually moved to O'ahu's northshore. Because it figures prominently in his interview, it is worth stating that Mr. Sharp is African-American.

His work at the Kalihi YMCA, and then later with Pālama Settlement, where he also ended up working with youth from Mayor Wright Homes, was geared towards "street gangs and . . . the hard-core kids," trying to get them involved in sports. He was accepted by the youth at the Kalihi position, but stated "it was kind of hard when I was at Mayor Wright's and Pālama [Settlement]" (UH-COH 1998:151).

He shared extensively about first coming to Pālama and becoming the head football coach, which also meant coaching the boys from Mayor Wright Homes:

> Football games, people be scared to go because the Pālama parents would be fighting if they lost. . . they were allowing these guys to bring booze and drink on the field and stuff. And there was not a lot of pride that I found in what the kids were doing. . .
>
> So, I had to make friends. I had to make friends with the parents first. . . We called all of the parents together from all the areas that had kids that was going to participate in the [sports] program. . . All I needed was their help and that is what I got. From the time that I started coaching Pālama, and I coached for fifteen years, from the day that I started to the day that I stopped coaching, I had the support of the community, the parents. . . you know why? Because we were winners. (UH-COH 1998:152)

He then goes on to discuss at length how he linked participation in sports at Pālama with doing well in school, finshing homework, and so on. He also talked about how the athletes were fed, and this helped everyone involved:

> The parents wanted their kids in the program because we didn't only have study hall, we had a training table, we fed 'em. (Laughs) Right out of Mayor Wright's they're eating on a training table, you know. So, this was something that turned the parents on because they could come to Pālama, get one good meal, and do their studies. (ibid.)

He went on to name several players, including Samoans, who ended up getting recruited to local schools such as St. Louis and Kamehameha, as well as the University of Hawai'i, including the Ma'afalas, Eddie Kealoha, Fituina Tua, the Noga brothers.

Don Snyder, born in Honolulu in 1943, was raised, along with two of his brothers, at Mayor Wright Homes by his mother (his parents had divorced, and his father lived on the mainland with his three older siblings). He played sports, took art lessons and learned how to play the clarinet at Pālama Settlement. After finishing his tour with the U.S. Navy, he earned a B.A. from the University of San Francisco in business (with a teaching certificate). He has lived on Maui ever since.

He shared that his mother was half Chinese, half Hawaiian, and that his father was Caucasian, so he, himself, is a mix. He discussed his first-hand recollections of growing up at Mayor Wright Homes:

> You know, it was a challenge. A real challenge. Because we had a variety of kinds of people that, you know, more the lower income. Because we were on welfare and everything at that time. And growing up there I met a lot of different people. We had people who would—gangsters in that area, some prositution going on. We had a lot of things like that going on, you know, shooting. But what really helped us was athletics. . . So Pālama Settlement was our saving grace. So we had a place of refuge. We would go there to get away from the other elements. (UH-COH 1998:522)

The interviewer then asked about what were some of the problems growing up at Mayor Wright's. Don Snyder answered as follows:

> Temptations. . . . Being poor, being on welfare, that lack of money. So you don't have supplies. You don't have equipment. You don't have the clothes. You steal. SO people go out there and go and take things for your needs. I used to go across the street to the store. And I took ice cream. I couldn't afford it. But you know, the guy at the store knew I was taking it. (UH-COH 1998:533)

Even after all the difficult times, however, Don Snyder said he had continuing associations with Pālama Settlement and Mayor Wright's for a long time:

> I still lived in Mayor Wright's. Yeah. You know, it's something about Mayor Wright's, Warren [the interviewer]. I mean, about Pālama Settlement. You never, never get away from it. It's always a part of you. When I went to Central [Intermediate], I used to walk to Central. 'Cause it was close to Mayor Wright's. I walked there. After school, I would start—at that time you met other friends, too, yeah? And I used to go to 'A'ala Park. (UH-COH 1998:532)

Jerry Tarutani, born in Kalihi in 1920, was the son of Japanese immigrants. His association with Pālama Settlement began in 1938 when he moved there with his mother and siblings. He played lots of sports there. He graduated from St. Louis School in 1938. He then taught judo at Pālama Settlement for an 35 years. He also served on the board of trustees.

Of relevance to Mayor Wright Homes, he discussed the fact that, unfortunately in his opinion, Pālama Settlement no longer (in the late 1990s, the time of the interview) served the people who need it most; that is, low-income folks with not enough opportunities. He extolled the good work of "Bobby" (Robert) Rath's father [James A. Rath], who started the settlement as "a place to come to learn any arts or crafts or

things like that.[5] And building their morale and dignity" (UH-COH 1998:612). He was disappointed that the settlement had gotten away from its original intent. "The guys that need it the most right now, in that community, is the Mayor Wright housing" (ibid.).

Fituina F. Tua, born in American Samoa in 1956, one of eight children, came to Hawai'i in 1958. He first lived across Liliha Street from Mayor Wright Homes, at what is now Kukui Gardens. Later, his family moved to Kamehameha IV Homes in Kalihi. At the age of 14, he started in the sports program at Pālama Settlement. In addition to earning a B.A. from San Jose State University, he also received a Master's degree from the University of Massachusetts. He has worked in the court system since 1991.

He shared that, when he lived across the street at (the current) Kukui Gardens, they lived on something called Horse Street [presumably a lane off of Liliha].

When he was young, presumably in the 1960s and maybe the 1970s, the family's landlord was Japanese, and the neighborhood was mixed, with Samoans, Filipinos and Hawaiians. He also remembers buildings and businesses owned by Japanese and Chinese in the area. He hung around with all the kids from the area, including Mayor Wright Homes' kids, and there was no sense that anyone from Mayor Wrights was any different from anyone else, just because it was public housing.

He recalls delivering newspapers around the area, and working with Mayor Wright's kids on this work. He also saw many of these same kids when he (and they) ended up at the juvenile detention center after getting in trouble.

Fituina Tua fondly remembers getting into football with coach John Sharp—whose interview is also summarized in this section. Fituina recalls:

> Mr. John Sharp came into my life when I was at Kam[ehameha] IV housing. He actually came down and was involved with my brother. And he saw a lot of kids, and he became involved, and got kids involved with sports. . . And then there really weren't a lot Blacks [in Hawai'i], you know. And they were kind of like role models when you saw them. You said, "Wow, yeah. I'd like to play for that guy." and that's how I became involved with Pālama Settlement. (UH-COH 1998:483)

He then went on to describe how instrumental John Sharp and others such as Eurlene Chambers (Piko) and Kenneth Ling were in helping keep kids on the straight and narrow, and helping them not only stay out of trouble, but thrive and prosper.

Jeff Yamashita, born in Honolulu in 1940, was raised by his mother at Pālama Settlement. He started frequenting Pālama Settlement when he was about seven years old, and eventually became a competitve swimmer. He served on the board of trustess for six years beginning in 1988. He had a long career as a police officer and investigator for the City and County of Honolulu. He worked as an undercover narcotics agent, and Mayor Wright Homes was one of the places he worked at.

He talked about the entire neighborhood area around Pālama Settlement and down to Mayor Wright's as a slum:

> Well, when people ask me that, I describe our neighborhood as a slum area. Not to boast or anything, but that's what it was, it was a—Mayor Wright's housing . . . was like a few blocks away, three blocks away. Lot of my friends came from that area, wasn't Mayor Wright's at that time [before 1953]. The time I was growing up was what we call kind of like "Hell's Half Acre," because it was a mixture of all kind of low-income people just living there, and a lot of run-down shacks, and really was a tough area. And where I was, we're kind of on the outskirts of that, but we played with these kids that, you know were our friends. (UH-COH 1998:707)

[5] See Robert Rath's interview in this section.

Jeff Yamashita said that, with Pālama Settlement as a kind of center to the area, there used to be much more of a community feeling, and that this most definitely included the kids and people from Mayor Wright's. He reckoned the change from what used to be a real community feel to something less so began in the late 1970s or early 1980s. He noted some (now) well-known local people such as Skippa Diaz came from Mayor Wright's.

In trying to explain some of the reasons why things changed so much, he talked about changing demographics at Mayor Wright Homes:

> Housing was, I think, was more family-oriented. Now it's more gangs, the families are having a hard time again. Because a mixture of immigrants, yeah, that come from different countries. I think the cultures are different. Whereas if you're local, you're local, even though you're of a different nationality, different ethnic background. We got along—Japanese, Chinese, Hawaiian. Now you have a problem with the Vietnamese, Koreans, Filipinos, and they don't understand each other. I think that's why they have problems over there, you know?

PREVIOUS ARCHAEOLOGICAL RESEARCH

In this section, we summarize relevant previous archaeological studies in order to reconstruct human use and modification of the land in and near the current project area. Given the age of the existing Mayor Wright Homes, which was constructed in the early 1950s (before the adoption of applicable historic-preservation and environmental laws starting in the late 1960s), no previous archaeological studies—prior to the most recent Archaeological Inventory Survey (AIS) by Monahan (currently in review)—have been conducted in the current project area. Similarly, the immediate surrounding area generally consists of commercial and residential buildings and infrastructure that was completed before the late 1960s. Therefore, with a few prominent exceptions, most of the nearby archaeological studies were conducted in support of roadway, utilities and other infrastructure improvements.

Nearby Archaeological Studies and Results

As discussed in detail below, a prominent, recent exception to this is an AIS by Cultural Surveys Hawai'i (Belluomini et al. 2016) of the American Savings Bank property across from 'A'ala Park, approximately 400 meters (1,312 ft.) east-southeast of the current project area. A large number of studies were conducted in Chinatown, on the east side of Nu'uanu Stream. Major archaeological studies were conducted in association with block developments in the 1990s at the River-Nimitz redevelopment, Kekaulike project, Marin Tower project and Liliha Civic Center.

Figure 29 is a graphic depiction of previous archaeological studies near the project area from a recent (2016) SHPD-approved AIS report (Belluomini et al. 2016:40). Figure 30 shows previously-identified archaeological sites—including burials—near the current project area from the same resource (ibid.:41).

Two fishponds—Kuwili (Site 5368) and Kawa (Site 5966)—were once located immediately south of the current project area. These fishponds were depicted on an 1855 map (see Figure 7), but appeared to have been filled in by at least 1878 (see Figure 11).

The closest burial site to the current project area (Site 7933) was recently documented by Belluomini et al. (2016) at the American Savings Bank property. A cluster of at least seven individuals, along with some pig and dog bones possibly representing buried animals associated with the human burials, was identified within a Land Commission Award (731 to Palile). The age of this site was interpreted as pre-Contact to post-Contact. All other known burials from the area are located on the other (east) side of the Nu'uanu Stream (a set of fragmentary human skeletal remains with no site number assigned at Foster Botanical Gardens; and numerous burials sites in Chinatown).

The closest previously-identified historic property to the current project area is a remnant of historic-period trolley (Site 5942) in the middle of King Street just south of its intersection with Liliha Street.

In addition to the burial cluster (Site 7933) found at the American Savings Bank project area, Belluomini et al. (2016) also documented the structural remains of LCA boundary walls (Site 7933) and the structural remains of a building foundation (Site 7935).

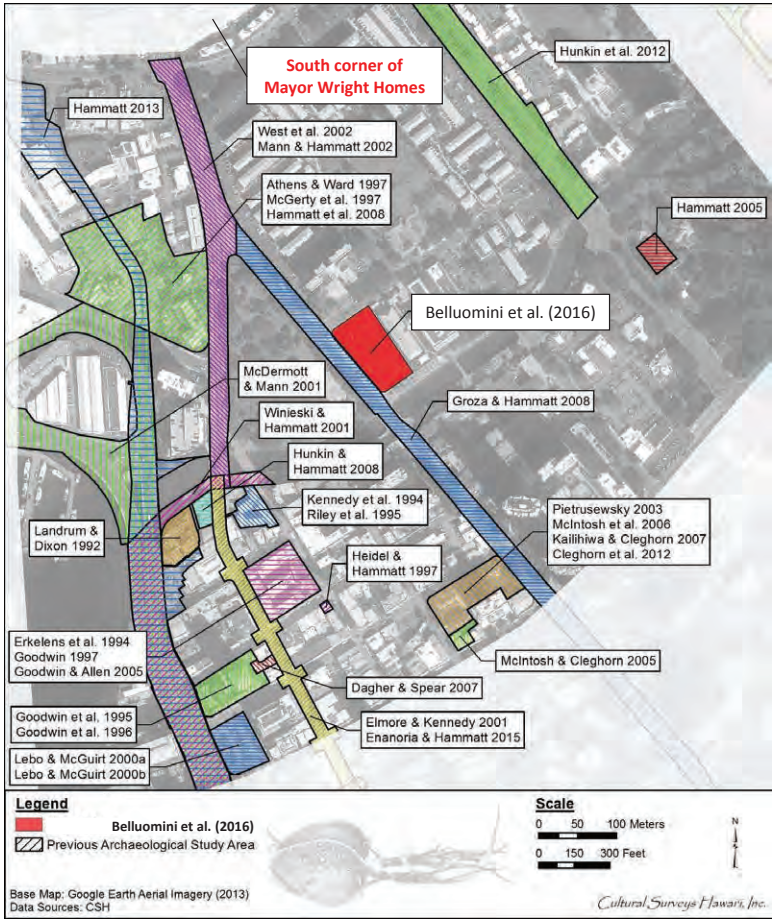

Figure 29. Cultural Surveys Hawai'i (2016:40) depiction of previous archaeological studies near the current project area; portion of current project area in upper left of this image; image slightly modified/annotated by TCP Hawai'i

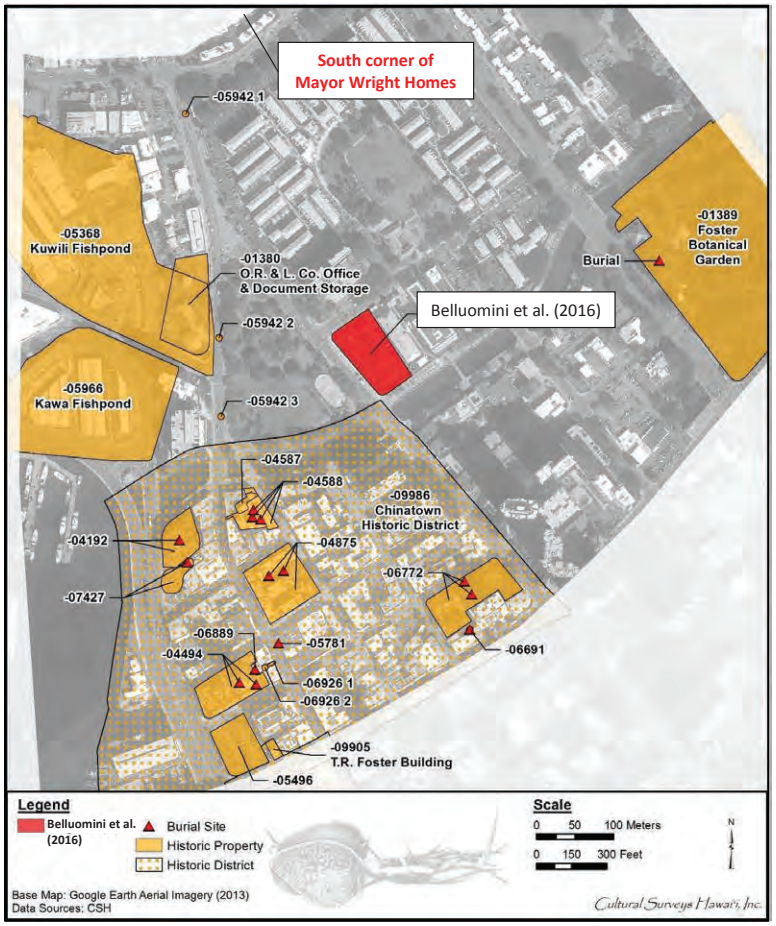

Figure 30. Cultural Surveys Hawai'i (2016:41) depiction of known archaeological sites near the current project area; portion of current project area in upper left of this image; image slightly modified/annotated by TCP Hawai'i

Results from the Current Project Area

As documented in Table 2, and graphically depicted in Figure 31, the AIS conducted recently by TCP Hawai'i (Monahan in review) identified four (4) historic properties: State Inventory of Historic Places (SIHP) # 50-80-14-8033, SIHP # 50-80-14-8034, SIHP # 50-80-14-8035, and SIHP # 50-80-14-8036.

- **Site 8033**—exposed in nearly all (21 of 24) of the trenches—is a subsurface layer, consisting of four (4) features. *Feature 1* is the widespread layer, itself. Trench #12, along the southwest boundary of the project area, is the only excavation where this subsurface layer is entirely missing (in the other two, Trench #s 11 and 23, this layer may have been removed by recent/modern disturbance). *Features 2 through 4* are filled-in garbage/debris pits emanating from the base of the subsurface layer (in Trench #s 16, 19 and 20, respectively). This site represents a project-area wide grading/bulldozing and pit-filling (dumping) event that occurred just prior to, and in preparation for, the construction of the Mayor Wright Homes residential complex (circa 1952-3). The site covers an area of approximately 14.0 acres. It is a subsurface layer with a great deal of variation in terms of its depth and thickness; it generally occurs between 20-30 cm below ground surface (upper limit of layer), with some trenches exposing this layer as shallow as 10-15 cm below ground surface (upper limit of layer), down to an average of 40-60 cm below ground surface (lower limit of layer), with some variation from this. Average thickness of this layer is approximately 30-50 cm.
- **Site 8034**—exposed in several trenches in the mauka (inland) portion of the project area (Trench #s 6, 7, 10, 15 & 17), is a subsurface layer consisting of gray clay interpreted as pond sediments, most likely the remnants of traditional Hawaiian lo'i kalo (irrigated, pond-field, taro cultivation). There is abundant historical evidence that, in pre-Contact times—before the development of Honolulu Harbor and in the early nineteenth century and subsequent urbanization—the project area represented a prime location for traditional Hawaiian subsistence cultivation of taro; and such activities continued in some portions into the early twentieth century. The upper portion of this sedimentary layer—and this site—appear to have been partially truncated by the grading/bulldozing. This site is discontinuous in its areal distribution, and its overall area is unknown. It is a subsurface layer with a great deal of variation in terms of its depth and thickness; it generally occurs between 20-65 cm below ground surface (upper limit of layer), with one trench (Trench #17) exposing this layer as deep as 95 cm below ground surface (upper limit of layer), down to an average of 60-90 cm below ground surface (lower limit of layer), with one deeper instance (Trench #17). Average thickness of this layer is approximately 40 cm.
- **Site 8035** consists of two features: Feature 1, an asphalt or concrete surface (exposed in Trench #11) dating from the late historic/early modern period. This old surface starts at 40 cm below the ground surface, and extends to an unknown depth (probably 10-15 cm). We do not know its area; and Feature 2, another (different) asphalt surface (exposed in Trench #12) dating from the late historic/early modern period. This old surface is located between 25-40 cm below the ground surface. We do not know its area.
- **Site 8036** is a set of very large drainage pipes (exposed in Trench #21) also dating from the late historic/early modern period. These large pipes are located between 75-140 cm below the ground surface. They extend to the north and south and unknown distance.

Also, a recent (2016) ALTA survey of the current project area depicts the location, orientation and configuration of a large number of walkways and sidewalks, some of which may be in excess of 50 years in age (i.e., they may be historic properties). These walkways and sidewalks may be considered components of the above-ground, architectural landscape.

Figure 31. Location of historic properties identified by TCP Hawai'i during this AIS and shallow lithified coral reef (brown dashed line) (see text discussion)

Table 2. Historic Properties in Project Area, Significance Assessments and Recommended Mitigation

SIHP #*	Formal Type	Function	Age	Sign. Assess.**	Recomm. Mitig.***
8033	Subsurface cultural layer (4 features)	Site preparation for construction of Mayor Wright Homes	1952-3	d, D	NFW
8034	Subsurface lo‘i kalo sedimentary layer (remnant)	Traditional, Hawaiian, irrigated taro pond-fields	Pre-Contact to historic period	d, D	NFW
8035	Subsurface asphalt/concrete surface (2 features)	Pavements, driveways or other similar surfaces	Early 20th century	d, D	NFW
8036	Pair of buried (subsurface) drainage pipes	Major drainage infrastructure	Early to middle 20th century	d, D	NFW

* Complete, formal State Inventory of Historic Places (SIHP) # is preceded by “50-80-14.”
** Significance Assessments: lower case letters = Hawai‘i State criteria; upper case letters = Federal criteria
*** Recommended Mitigation: NFW = No further (historic-preservation or archaeological) work

SIHP # 50-80-14-8033 was evaluated as significant under criteria d (State) and D (Federal) for its intrinsic informational value to research on the history of middle twentieth century urbanization in Honolulu, in particular, the advent of major public housing initiatives—and construction of the Mayor Wright Homes—by the State of Hawai‘i.

SIHP # 50-80-14-8034 was evaluated as significant under criteria d (State) and D (Federal) for its intrinsic informational value to research on the history of traditional Hawaiian agricultural practices in pre-Contact times as well as the later, historic period in Honolulu and the lower Nu‘uanu flood plain west of the stream.

SIHP # 50-80-14-8035 was evaluated as significant under criteria d (State) and D (Federal) for its intrinsic informational value to research on the history of early to middle twentieth century urbanization in Honolulu; and land use in the project area prior to the construction of the Mayor Wright Homes.

SIHP # 50-80-14-8036 was evaluated as significant under criteria d (State) and D (Federal) for its intrinsic informational value to research on the history of middle twentieth century urbanization in Honolulu, in particular, the advent of major public housing initiatives—and construction of the Mayor Wright Homes—by the State of Hawai‘i.

Several geoarchaeological observations are also worth noting. First, when not disturbed, truncated or removed by historic-period activities, the main sedimentary layer below the uppermost topsoil/fill and above any sterile sediments is clayey loam. Second, bedrock consists primarily of decomposing basalt, but in several cases it is lithified coral reef. The water table was reached before hitting bedrock, between 220–225 cm (7.2–7.4 ft.), in only two trenches (#s 20 and 21) along the southeast side of the project area. Third, the lithified coral reef was exposed at a relatively shallow depth—less than 1.0 m (3.3 ft.)—in several trenches (#s 1, 2, 3, 4, 5, 6 and 23) along the northwest side of the project area (see Figure 31). This distribution of shallow coral shelf is interesting because it corresponds with a feature depicted on von Kotzebue’s (georeferenced) 1817 map (see Figure 5), which appears to be an elevated (pu‘u-type) landform; it is probably a late Pleistocene formation representing the Waimānalo Sea Stand dating to ~120,000 years before present, when sea levels in Hawai‘i were ~7.5 m (24.8 ft.) above current levels (Macdonald et al. 1983; Ziegler 2002). Some of these trenches with shallow lithified coral shelf (#s 1, 2, 3, and 5) also had volcanic cinder deposited in channels, cracks and holes atop the coral. Lithified coral reef bedrock was also identified in three trenches in the southeast quadrant of the project area, but at a greater depth (150–230 cm [4.9–7.5 ft.]). Finally, clean beach sand was found in only one trench (#24), as a thin (5-15 cm) band of fill sediments.

Figure 32 through Figure 41 are representative photographs from the recent survey by TCP Hawai‘i at Mayor Wright Homes.

Temporally-diagnostic Glass Bottles from the Mayor Wright Survey

We collected historic artifacts that retained chronologically-diagnostic information, such as glass bottles with maker's marks and other indicators of their place and/or time of manufacture. As summarized in Table 3, a total of eighteen (18) glass bottles were collected for description and analysis from four (4) excavation units (Trench #s 14, 17, 19 and 20). The bottles we were able to identify indicate earliest dates of manufacture were no earlier than the 1920s. The latest (Catalogue #17) is from the 1950s. All of the glass bottles are depicted with photographs that follow the table. Photograph numbers for each catalogue number are listed in the table.

Table 3. Accessioned Glass Bottles from Mayor Wright Homes Project Area Excavations

Cat. #	Trench #	Provenience	Description and Comments
1	20	Site 8033, Feature 4, 60-200 cmbs	Clear glass, complete, medicine bottle, with stylized number "8" on bottom; Figure 42
2	20	Site 8033, Feature 4, 60-200 cmbs	Clear glass, complete, perfume bottle; with letter "K" embossed on bottom; **matches the Knox Glass Bottle Co., manufactured from 1932-1968;** Figure 42

INTERVIEW SUMMARIES

As explained in the Methods section, we reached out to many people to ask if they would like to participate in interviews for this CIA. Of these, only two agreed to be formally interviewed. The results of these two interviews—with Theresa Boter and Deriah Aana—are summarized below. Following the two interview summaries, we include a short subsection on recommendations made by these people for the proposed project.

Theresa Boter Interview

Chris Monahan interviewed Theresa Boter by phone (she was in California at the time) for about 75 minutes on April 7, 2017.

Biographical Notes

Therese Boter is 19 years old, was born in the Philippines, and grew up at Mayor Wright Homes with her parents and one (older) brother. She was a few months old when her mother brought her to Hawai‘i. Her father was already in Hawai‘i at this time, and, as Therese recently learned from her mother, her coming to the islands was a struggle and an event that almost didn’t happen due to immigration challenges at the time. Therese, currently a student at Pitzer College in Southern California, is studying economics and education. Because of her parents’ hard work and protective nature over their daughter, and, likewise, Therese’s work ethic in the public schools she attended, she has been able to benefit from different educational programs and opportunities, including LEDA (Leadership Enterprise for a Diverse America), which have allowed her to travel and study on the U.S. mainland.

Discussion Themes

These are subject themes that emerged naturally during the interview and discussion:

1. Despite Mayor Wright Homes’ reputation as a difficult to place to live, and widespread, negative stereotypes about what it’s like to live there, Therese also has feelings of pride about where she grew up. Her struggles helped her develop a strong desire to succeed in life, no matter what obstacles she may face.
2. Her parents were extremely protective of Therese, and she wasn’t allowed to go outside much at Mayor Wright Homes because of safety concerns.
3. Feelings of emotional hurt as she grew up at the ways people from outside of Mayor Wright talked about those who lived there.
4. Gang problems, mostly based on ethnicity/cultural groups, and violence were concerns not only at Mayor Wright but also some of the schools she attended in greater Kalihi.
5. Educational opportunities such as the LEDA program have provided her with the chance to succeed and, ultimately, to help her family and community.

Major Recommendations Related to the Cultural Impact Assessment

1. Therese recommends development of a community-based garden program at the redeveloped Mayor Wright Homes property so that residents can benefit from the raising and eating of fresh food. During our discussion, Chris Monahan shared with Therese that, well into the 20th century, major portions of the Mayor Wright property were still being used to grow food, including taro and other crops. Historic maps from as late as the 1920s show this. Therefore, her recommendation about starting a community garden project or program would be consistent with the history of this place.

Narrative Notes

After first living in Wai‘anae until she was 2 or 3 years old, Therese’s family moved to Mayor Wright, where she has lived ever since. She described her family as “stay at home” people, relatively quiet or shy Filipinos who pretty much kept to themselves at Mayor Wright.

When asked about any cultural traditions or practices she remembered at Mayor Wright, Therese recalled an annual, December-time tradition that she watched from inside her house where people paraded around, singing, and banging pots and pans. Because her parents were so over-protective, due to the rough nature of many of the people who lived at Mayor Wright, Therese had to experience this annual celebration from her window, inside the apartment.

Therese had both positive and negative experiences and recollections about growing up at Mayor Wright. She shared about an incident that occurred when she was young when a neighbor’s son was killed at a nearby bus stop by another Mayor Wright resident. The two young men (the perpetrator and the victim) were of different cultural/ethnic backgrounds. She remembers the racial tension was very high and scary, and it was difficult for all to deal with.

Another time, her father was physically beaten up by members of another cultural/ethnic group (also neighbors at Mayor Wright). Her family tried to keep a nice, clean lanai, with a small garden area, but some neighbors would throw their trash everywhere and engage in other unsavory/unclean activities in Therese’s family’s space. Her father tried to help her mother, who just wanted to have a clean garden space. He tried talking to the neighbors. He eventually called the police. Her father was eventually beaten up by one of the neighbors. She remembers hating living at Mayor Wright during this difficult time, asking herself questions such as “why do we have to be poor?” “Why are we here at Mayor Wright?” This was a time of fear and anger.

In general, one of the negative aspects of life at Mayor Wright, and also the many stereotypes about life there by people who lived elsewhere, was the strong racial/ethnic divisions that ran among certain groups.

We talked about the public schools Therese attended, and she said kids at Mayor Wright went to Kaiulani Elementary, Central Middle School, and McKinley High School, but that her parents worked to get her geographic exemptions starting in middle school, where she attended Kalakaua Middle School because there were lots of Filipinos there. Then, rather than go to McKinley, she attended Farrington High School. When at Farrington, she began to hear bad stories about Mayor Wright Homes and its people, heard it described as a ghetto for really the first time in her life, and it surprised and hurt her feelings. When she then ventured outside of Kalihi, she began to hear the same types of stereotypical stories and biases about Farrington High School.

Throughout all of this, she stayed home when not at school, and worked hard to get her studies done, which was not always easy at Mayor Wright due to the close quarters people live in, the noise of packs of kids running around after school, etc. She became very involved in extra-curricular activities at high school, joining several clubs to have a safe place to stay away from home. School was a safer place, but was still far from perfect. There were many gangs, gang activities and fights. She tried her best to focus on the good and the positive, whether at school or at Mayor Wright.

The gangs, which were mostly based on ethnicity, were never a part of her life, and she managed to avoid the troubles surrounding gang life.

Her brother, who is older than Therese, is somewhat different from her in terms of his ambitions. He was supposed to go to school locally on O‘ahu to study criminal justice, but he never attended, although his parents didn’t know this for some time. He ended up working as a security guard, which is also her father’s job.

Therese told a story, that her mother just recently told her about, of the time when she was still a baby in the Philippines, before coming to Hawai‘i. Her father had already gotten back to Hawai‘i, but Therese and

her mom were stuck in the Philippines, trying to get back to Hawai‘i. Despite many difficulties and obstacles, including many unsuccessful trips to government offices to get the right paperwork, a kind of “guardian angel” woman in the right office helped them eventually get here, a kind of small miracle in Therese’s life.

Because of all these life experiences, she has a strong desire to succeed, a kind of tenacity to rise above her circumstances, which brought the discussion around to her participation in the LEDA (Leadership Enterprise for a Diverse America) program—based in New York City, a “national nonprofit organization dedicated to diversifying the national leadership pipeline by helping high-achieving students from low-income backgrounds gain admission to our nation’s most selective colleges and supporting their success at these institutions” (source: ledascholars.org/). Through LEDA, Therese has been able to fly to Princeton, New Jersey, for an initial, 7-week program of study and mentoring, the result of which was she realized she was not the worst off among her LEDA peers, which helped put Mayor Wright, Kalihi, and Honolulu in perspective for her. She took extremely difficult college courses on this program, and she discovered she had an accent, which surprised her! Since then, she has been back to Princeton, and has also traveled to New York City, Newport (Rhode Island), and Boston the past couple years. In fact, this summer she will be working as a mentor at LEDA, completing the cycle that was begun a few years ago.

Therese finished her interview, and our discussion, talking about the importance of incorporating a community-based garden program at the redeveloped Mayor Wright Homes property so that residents can benefit from the raising and eating of fresh food. This recommendation is discussed above. Therese shared a recent article from Civil Beat that describes the importance of programs like this for people in Hawai‘i. Therese followed up on our conversation a day or two later by providing a link to this important article.

Deriah Aana (DeMello) Interview

Chris Monahan interviewed Deriah and her sister in person at her home for almost 2 hours on April 19, 2017. I originally spoke with Deriah on the phone, and set up the time to talk story at her place. When I arrived, Deriah’s younger sister Donna also participated and stayed for the entire interview/discussion. The information below does not distinguish between which sister said what because there was no disagreement about any of the important issues summarized below. Later, near the end of our discussion, around 3:30 pm, another sister, Vanessa, returned home and participated in the discussion, adding some important information that all agreed upon. Once again, we do not distinguish those comments offered by the third sister.

Biographical Notes

Deriah Aana (maiden name DeMello) is 69 years old, was born in 1947 and raised on O‘ahu, and grew up in the Honolulu area. She has lived at Mayor Wright Homes since 1970. Her mother, who passed away about 10 years ago, was Hawaiian. Her father was of Portuguese (local) ancestry. Her Hawaiian husband, from which the name Aana derives, passed away, but they were divorced many years ago (around 1973). Her younger sister, who is 56 years old, was also born and raised on O‘ahu, and grew up in the Honolulu area. When she was young, she was raised near School and Houghtailing streets. She has lived at Mayor Wright for many years. I did not record any specific information about the third sister, who arrived near the end of our time. I did learn that she has worked for the State Judiciary in some capacity for approximately 25 years. I didn’t get any information of what kind of work Deriah or her younger sister did in the past.

Discussion Themes

These are subject themes that emerged naturally during the interview and discussion:

1. Hearing from older relatives that, before the construction of Mayor Wright Homes, the block was full of lo‘i (irrigated taro fields) and also that there were burials. They also remembered when the neighborhood was surrounded by low, wooden structures, including houses, not tall buildings and apartment buildings.
2. There was a time, back in the 1970s and 1980s especially, when Mayor Wright had a real sense of community; it was a family place where people knew each other, looked out for each other, helped raise and discipline (if necessary) other peoples’ children. Back then, there were many community programs and recreational/holiday events at Mayor Wright, sponsored by the housing authority, where the kids and teens had safe activities to engage in.
3. They expressed many, detailed problems with the recent/current management and the way the place is run, with too many restrictions and rules, weak and ineffective security, and no voice for the long-term tenants, especially Hawaiians and kama‘āina. These policies and problems prevent people like Deriah Aana and her sisters from fully enjoying the kind of Hawaiian-style life they should be able to live (e.g., keeping a garden, barbequing in front of their house and socializing with their ‘ohana in their yard, etc.). Rather than feeling like a community place, Mayor Wright now feels like a prison where its residents are literally fenced in.
4. Some of the ethnic/cultural groups that most recently arrived in Hawai‘i, and who occupy many of the units, do not understand and practice the basic societal rules of Hawai‘i and the U.S. Lots of the violence, including the murder of long-time resident’s son, is caused by young men and gangs of some of these newly-arrived ethnic/cultural groups.
5. Deriah and her sisters are extremely concerned about a lack of specific information they are receiving about the process of moving them out (e.g., where they will be placed temporarily, and when they will be moved back in).

Major Recommendations Related to the Cultural Impact Assessment

1. The redeveloped Mayor Wright Homes property should include places where the tenants can plant small gardens in order to live the kind of Hawaiian-style life they grew up with, and to be allowed to grow culturally-significant plants such as ti leaf and others (e.g., bananas, papaya, ginger, plumeria, etc.).
2. The redeveloped Mayor Wright Homes property should include a funding stream whereby community programs, events and activities are designed and implemented that bring people of different ethnic/cultural groups together, and that provide safe and healthy activities for kids and teens. These programs, events and activities could include traditional and customary (cultural) practices that highlight the different groups that call Mayor Wright home.

Narrative Notes

We began by talking a bit about Deriah’s last name, Aana from her husband, but her maiden name was DeMello, from her Portuguese father.

The sisters talked about not knowing about the details of their upcoming move out, and being concerned about this uncertainty, which is causing stress.

Deriah’s younger sister mentioned that kupuna told her about there being lo‘i kalo (taro patches) all over the area of Mayor Wright. She was also told about there being burials out there. When asked about the location of burials, if she were ever told this information, a specific location was not explained; the interviewee could not determine where they may be.

They requested more information about the upcoming move out of Mayor Wright Homes, and stated they were not getting definitive answers from those they asked. They would like the state’s point of contact for

the Housing Authority to give them answers to their questions, rather than the on-site manager at Mayor Wright, who doesn't seem to know the details.

We discussed about how Aunty Deriah has lived at Mayor Wright Homes for 47 years, since 1970. She originally moved in with her four children. She and her ex-husband divorced in 1973.

The discussion returned again to the fear and anxiety of not knowing the details of where they would be moved to, and if it would be close by to where they are now. Deriah and her younger sister Donna are both on fixed incomes with some medical needs, doctors' offices to get to, etc., which are all near to home right now. They fear being moved far away to a part of the island that would make it difficult or impossible to get to the places they need to get to.

According to a kupuna, the street name, Vineyard, was named after an area used to grow grapes for a winery.

When they were young, they used to swim in the fresh-water spring of Kunawai, mauka of Mayor Wright Homes, as well as other springs in the area including Waikahalulu (just above School Street). These places used to be clean and accessible for the kids to use.

They talked about the block immediately east of Mayor Wright Homes that includes the Kukui Gardens apartment complex. Before it was developed into apartments, it used to be a combination of vacant land and small, wooden-framed structures scattered about. It was also a place where transient ("homeless") people would camp out/hang out. They used to cut through this area to reach Central Intermediate (Middle) School.

In Deriah's early days, she remembers her father going across King Street to the ice house to pick up block ice for the family. The ice house was near the old (OR & L) train tracks.

Discussion then turned away from remembrances of the old days to the relatively recent (last 10 or 15 years) arrival of other ethnic/cultural groups such as the Samoans and Micronesians. There was extensive discussion of problems associated with some of the recent arrivals, including the very sad story of the murder of the son of their neighbor. There was a lot of talk about the rise in violence and problems with security now at Mayor Wright. The security guards, who describe their jobs as "monitors," do not inspire confidence with Deriah and her 'ohana.

They then told a story—well documented in the newspapers of the time—of being without hot water for about 10 years. A lawsuit settlement, reached around the time Neil Abercrombie was governor (2010-2014), resulted in them receiving a check for several hundred dollars, which they pointed out was less than $100 per year of not having hot water.

Discussion turned to other quality of life issues including not being allowed to have certain plants or gardens in front of or around their homes anymore, and not being allowed to barbeque outside to enjoy the fresh air and gather with friends and family outside. In particular, Deriah was upset that the management recently ripped out a line of ginger shrubs she had planted way back in 1970 in front of her front door area that provided a green privacy "fence." Other similar actions, such as the management's removal of banana and papaya trees as well as ti leaf plants, were also extremely upsetting to Deriah and her 'ohana. They have been told they cannot use outside water to water their gardens and outside plants, and management removed outside watering hardware some time ago due to excess watering by some residents.

The importance of having places to grow plants, including food plants, outside was highlighted.

They discussed past politicians who did good things for Mayor Wright, including Frank Fasi (Mayor of Honolulu for 22 years between 1968 and 1994) and George Arioshi (Governor from 1974-1986); as well as those who did little for its residents (including John Waihee, Neil Abercrombie and the current governor, David Ige).

Mayor Wright Homes was good place to live in the 1970s and 80s, where people got long and shared what they had. Hawaiians and locals such as Deriah and her 'ohana had good relations with Filipinos, Chinese, Vietnamese and other Hawaiian/locals (e.g., Portuguese). Now things are totally different. There used to be much more green space for the kids to play. For example, just behind (east of) Building 14, and which now is an asphalt road, used to be all grass and greenery. Life back in the 1970s and 1980s was more of a family/community-type situation.

They also spoke of a rule they thought was part of living at Mayor Wrights that involved some kind of community service component. They were somewhat ambiguous about this, and seemed to think it wasn't being enforced by management.

Back when they were younger and living at Mayor Wright Homes, there used to be all sorts of management-sponsored activities and gatherings, such as movie nights and dances for young people. This was before fences were put up around the property. There used to be a junior community policing/patrolling program that imbued the young people with a sense of ownership and responsibility for Mayor Wright Homes, which used to be a much safer place.

There used be May Day celebrations, and other special days celebrated, even Father's and Mother's Days. These would be management-sponsored events and activities that people looked forward to and that enhanced a sense of collective kuleana (responsibility) for the place.

Deriah and her sisters fondly remember these good days at Mayor Wright Homes, and recommend efforts be made to invest in community-building programs and activities in the future.

Recommendations from Interviews with Community Members

The following summarizes recommendations from the interviews:

1. Include places where the residents can plant small gardens in order to live the kind of Hawaiian-style life they grew up with, and to be allowed to grow culturally-significant plants such as ti leaf and others (e.g., bananas, papaya, ginger, plumeria, etc.).
2. Include a funding stream whereby community programs, events and activities are designed and implemented that bring people of different ethnic/cultural groups together, and that provide safe and healthy activities for kids and teens. These programs, events and activities could include traditional and customary (cultural) practices that highlight the different groups that call Mayor Wright home.
3. Develop a community-based garden program at the redeveloped Mayor Wright Homes property so that residents can benefit from the raising and eating of fresh food. Well into the 20th century, major portions of the Mayor Wright property were still being used to grow food, including taro and other crops. Historic maps from as late as the 1920s show this. Therefore, this recommendation about starting a community garden project or program would be consistent with the history of this place.

CULTURAL IMPACT ANALYSIS

The following recommendations are based on the formal interviews conducted, as well as input from others interviewed during a previous oral-history project (i.e., UH-COH 1998).

1. Include places where the tenants can plant small gardens in order to live the kind of Hawaiian-style life they grew up with, and to be allowed to grow culturally-significant plants such as ti leaf and others (e.g., bananas, papaya, ginger, plumeria, etc.).
2. Include a funding stream whereby community programs, events and activities are designed and implemented that bring people of different ethnic/cultural groups together, and that provide safe and healthy activities for kids and teens. These programs, events and activities could include traditional and customary (cultural) practices that highlight the different groups that call Mayor Wright home. The idea here is to help build community.
3. Develop a community-based garden program at the redeveloped Mayor Wright Homes property so that residents can benefit from the raising and eating of fresh food. Well into the 20th century, major portions of the Mayor Wright property were still being used to grow food, including taro and other crops. Historic maps from as late as the 1920s show this continuing pattern of land use. Therefore, this recommendation about starting a community garden project or program would be consistent with the history of this place.

CONCLUSION

TCP Hawai‘i, LLC, has completed this Cultural Impact Assessment (CIA) of an approximately 15.3-acre project area in Honolulu in support of the Mayor Wright Homes Redevelopment Project (TMK [1] 1-7-029:003). The landowner is the Hawai‘i Public Housing Authority. The project area, which consists of the TMK parcel in the context of the surrounding neighborhoods of Honolulu, is bounded by North King Street, Pua Lane, Vineyard Boulevard, and Liliha Street in a thoroughly urbanized/developed part of Honolulu west of the channelized lower Nu‘uanu Stream.

The information has been gathered to support an Environmental Impact Statement (EIS) of the redevelopment of Mayor Wright Homes, a public housing complex built by the HPHA that was first occupied in 1952 or 1953 (depending on the source). The proposed undertaking will replace the existing 364 residential units—currently consisting of 35 separate, low-rise buildings (plus an administration building)—with an entirely new mixed-use, mixed-income development comprised of up to 2,500 residential units and up to 80,000 square feet of commercial uses (note, when we started this CIA, the number of new residential units was originally described as 1,000 to 1,500, but this was recently changed to 2,500). This project is considered to be part of the Transit-Oriented Development (TOD) associated with construction of the Honolulu rail transit project. There have not been any previous CIAs completed in the project area because the Mayor Wright Homes were built prior to the introduction of applicable environmental assessment laws (starting in the late 1960s). This CIA satisfies the state Office of Environmental Quality Control’s (OEQC) guidelines for assessing cultural impacts. This document is a synthesis of previously obtained information, new interviews, and details of the proposed project.

In accordance with HRS 6E and Section 106 of the National Historic Preservation Act (NHPA), extensive community outreach and consultation was conducted with numerous individuals and agencies, including Native Hawaiian organizations. The consultation objectives were (1) to provide notification that this project could affect cultural resources and practices of interest to the community; (2) to seek consulted party views on the methods by which we identified and evaluated cultural resources and practices in the project area; and (3) to solicit consulted party views on the proposed undertaking’s potential effects on these things.

Through extensive archival research, including historical map analysis and review of Māhele ‘Āina (Land Commission) records, we present detailed information and analysis on a wide variety of topics, including: the Hawaiian cultural landscape, middle nineteenth-century developments in and near the project area, royal residences of Kapālama, early twentieth-century developments in and near the project area, oral history information from the twentieth-century in and near the project area (including interview summaries from a study of Pālama Settlement), results of nearby archaeological studies and a new archaeological survey of the project area by TCP Hawai‘i, and results of new interviews by TCP Hawai‘i conducted for this CIA.

All of this information forms the basis for several recommendations we made in the previous section regarding the redevelopment of Mayor Wright Homes.

APPENDIX A: State OEQC Guidelines for Assessing Cultural Impacts

Excerpt (pp. 11–13) from *Guide to the Implementation and Practice of the Hawaii Environmental Policy Act,* 2012 Edition, State of Hawai'i, Office of Environmental Quality Control (available online at http://oeqc.doh.hawaii.gov/Shared%20Documents/Misc_Documents/Guide%20to%20the%20Implementation%20and%20Practice%20of%20the%20HEPA.pdf)

GUIDELINES FOR ASSESSING CULTURAL IMPACTS

(Adopted by the Environmental Council, State of Hawaii, November 19, 1997)

I. INTRODUCTION

It is the policy of the State of Hawaii under Chapter 343, HRS, to alert decision makers through the environmental assessment process about significant environmental effects which may result from the implementation of certain actions. An environmental assessment of cultural impacts gathers information about cultural practices and cultural features that may be affected by actions subject to Chapter 343, and promotes responsible decision-making.

Articles IX and XII of the State Constitution, other state laws and the courts of the state require government agencies to promote and preserve cultural beliefs, practices, and resources of native Hawaiians and other ethnic groups. Chapter 343 also requires environmental assessment of cultural resources, in determining the significance of a proposed project.

The Environmental Council encourages preparers of environmental assessments and environmental impact statements to analyze the impact of a proposed action on cultural practices and features associated with the project area. The Council provides the following methodology and content protocol as guidance for any assessment of a project that may significantly affect cultural resources.

II. CULTURAL IMPACT ASSESSMENT METHODOLOGY

Cultural impacts differ from other types of impacts assessed in environmental assessments or environmental impact statements. A cultural impact assessment includes information relating to the practices and beliefs of a particular cultural or ethnic group or groups.

Such information may be obtained through scoping community meetings, ethnographic interviews and oral histories. Information provided by knowledgeable informants, including traditional cultural practitioners, can be applied to the analysis of cultural impacts in conjunction with information concerning cultural practices and features obtained through consultation and from documentary research.

In scoping the cultural portion of an environmental assessment, the geographical extent of the inquiry should, in most instances, be greater than the area over which the proposed action will take place. This is to ensure that cultural practices which may not occur within the boundaries of the project area, but which may nonetheless be affected, are included in the assessment. Thus, for example, a proposed action that may not physically alter gathering practices, but may affect access to gathering areas would be included in the assessment. An ahupua'a is usually the appropriate geographical unit to begin an assessment of cultural impacts of a proposed action, particularly if it includes all of the types of cultural practices associated with the project area. In some cases, cultural practices are likely to extend beyond the ahupua'a and the geographical extent of the study area should take into account those cultural practices.

The historical period studied in a cultural impact assessment should commence with the initial presence in the area of the particular group whose cultural practices and features are being assessed. The types of cultural practices and beliefs subject to assessment may

include subsistence, commercial, residential, agricultural, access-related, recreational, and religious and spiritual customs.

The types of cultural resources subject to assessment may include traditional cultural properties or other types of historic sites, both man made and natural, including submerged cultural resources, which support such cultural practices and beliefs.

If the subject area is in a developed urban setting, cultural impacts must still be assessed. Many incorrectly assume that the presence of urban infrastructure effectively precludes consideration of current cultural factors. For example, persons are known to gather kauna`oa, `ilima, `uhaloa, noni or ki on the grassy slopes and ramps of the H-1 freeway and some state highways on the neighbor islands. Certain landmarks and physical features are used by Hawaiian navigators for sailing, and the lines of sight from landmarks to the coast by fisherman to locate certain fishing spots. Blocking these features by the construction of buildings or tanks may constitute an adverse cultural impact.

The Environmental Council recommends that preparers of assessments analyzing cultural impacts adopt the following protocol:

A. Identify and consult with individuals and organizations with expertise concerning the types of cultural resources, practices and beliefs found within the broad geographical area, e.g. district or ahupua'a;
B. Identify and consult with individuals and organizations with knowledge of the area potentially affected by the proposed action;
C. Receive information from or conduct ethnographic interviews and oral histories with persons having knowledge of the potentially affected area;
D. Conduct ethnographic, historical, anthropological, sociological, and other culturally related documentary research;
E. Identify and describe the cultural resources, practices, and beliefs located within the potentially affected area; and
F. Assess the impact of the proposed action, alternatives to the proposed action, and mitigation measures, on the cultural resources, practices and beliefs identified.

Interviews and oral histories with knowledgeable individuals may be recorded, if consent is given, and field visits by preparers accompanied by informants are encouraged. Persons interviewed should be afforded an opportunity to review the record of the interview, and consent to publish the record should be obtained whenever possible. For example, the precise location of human burials is likely to be withheld from a cultural impact assessment, but it is important that the document identify the impact a project would have on the burials. At times an informant may provide information only on the condition that it remains in confidence. The wishes of the informant should be respected.

Primary source materials reviewed and analyzed may include, as appropriate: Mahele, land court, census and tax records including testimonies; vital statistics records; family histories and genealogies; previously published or recorded ethnographic interviews and oral histories; community studies, old maps and photographs; and other archival documents, including correspondence, newspaper or almanac articles, and visitor journals. Secondary source materials such as historical, sociological and anthropological texts manuscripts, and similar materials published and unpublished, should also be consulted. Other materials, which should be examined, include prior land use proposals, decisions, and rulings, which pertain to the study area.

III. CULTURAL IMPACT ASSESSMENT CONTENTS

In addition to the content requirements for environmental assessments and environmental impact statements, which are set out in HAR §11-200-10 and 16 through 18, the portion of the assessment concerning cultural impacts should address, but not necessarily be limited to, the following matters:

A. A discussion of the methods applied and results of consultation with individuals and organizations identified by the preparer as being familiar with cultural practices and features associated with the project area, including any constraints or limitations which might have affected the quality of the information obtained.
B. A description of methods adopted by the preparer to identify, locate, and select the persons interviewed, including a discussion of the level of effort undertaken.
C. Ethnographic and oral history interview procedures, including the circumstances under which the interviews were conducted, and any constraints or limitations which might have affected the quality of the information obtained.
D. Biographical information concerning the individuals and organizations consulted, their particular expertise, and their historical and genealogical relationship to the project area, as well as information concerning the persons submitting information or interviewed, their particular knowledge and cultural expertise, if any, and their historical and genealogical relationship to the project area.
E. A discussion concerning historical and cultural source materials consulted, the institutions and repositories searched and the level of effort undertaken. This discussion should include, if appropriate, the particular perspective of the authors, any opposing views, and any other relevant constraints, limitations or biases.
F. A discussion concerning the cultural resources, practices and beliefs identified, and, for resources and practices, their location within the broad geographical area in which the proposed action is located, as well as their direct or indirect significance or connection to the project site.
G. A discussion concerning the nature of the cultural practices and beliefs, and the significance of the cultural resources within the project area affected directly or indirectly by the proposed project.
H. An explanation of confidential information that has been withheld from public disclosure in the assessment.
I. A discussion concerning any conflicting information in regard to identified cultural resources, practices and beliefs.
J. An analysis of the potential effect of any proposed physical alteration on cultural resources, practices or beliefs; the potential of the proposed action to isolate cultural resources, practices or beliefs from their setting; and the potential of the proposed action to introduce elements which may alter the setting in which cultural practices take place.
K. A bibliography of references, and attached records of interviews which were allowed to be disclosed.
L. The inclusion of this information will help make environmental assessments and environmental impact statements complete and meet the requirements of Chapter 343, HRS. If you have any questions, please call 586-4185. You may ask OEQC if a directory of cultural impacts assessment providers is available.

APPENDIX B: CONSULTATION CORRESPONDANCE

This appendix includes all formal consultation sent by TCP Hawai‘i, LLC, in support of the subject Cultural Impact Assessment (CIA). It also includes one formal, written response we received (from OHA).

Documents included in this appendix:

1. Pages A-2 to A-7: Sample of initial consultation outreach letter sent to the following individuals and agencies in late May/early June, 2016: (a) SHPD/DLNR (Administrator Downer, Archaeology Branch Chief Susan Lebo, O‘ahu Burial Site Program staff Regina Hilo, and Ka‘āhiki Solis); (b) OHA (Ka Pouhana/CEO Crabbe and staff in Compliance, Kai Markell and Lauren Morawski); (c) Kalihi-Palama Neighborhood Board (Chair Ryan Mandado); (d) Kalihi-Palama Hawaiian Civic Club (Pelekikena/President Leimomi Khan); (e) Cynthia Yoshida (Public Housing Supervisor, MWH); (f) Historic Hawaii Foundation (Kirsten Faulkner); (g) Ka‘anohi Paulette Kaleikini (Native Hawaiian, cultural descendant, Honolulu area); (h) Michael Lee (Native Hawaiian, cultural descendant, Honolulu area).
2. Page A-8: Formal, written response from OHA dated June 28, 2016.

TCP Hawai'i, LLC

Documenting Traditional Cultural Properties of Hawai'i
Preserving and Restoring Cultural and Natural Resources of Hawai'i

May 25, 2016

To: **Mr. Kamana'opono Crabbe, Ph.D., Ka Pouhana (CEO), Office of Hawaiian Affairs, State of Hawai'i**

Re: **Initiation of Section 106 (36 CFR Part 800) Consultation for Mayor Wright Homes Redevelopment Project, Honolulu Ahupua'a, Honolulu (Kona) District TMK (1) 1-7-029: 003**

Aloha Mr. Crabbe,

On behalf of the lead agency for the proposed undertaking, the U.S. Department of Housing and Urban Development (HUD); and the landowner, the Hawai'i Public Housing Authority (HPHA); and in coordination with its national planner, Hunt Companies, Inc.; and its local planner, PBR Hawaii & Associates, Inc., TCP Hawai'i, LLC, is conducting an Archaeological Inventory Survey (AIS) and a Cultural Impact Assessment (CIA) of an approximately 15.3-acre project area in Honolulu in support of the Mayor Wright Homes Redevelopment Project (TMK [1] 1-7-029:003).

The Area of Potential Effect (APE) is the same as the physical footprint of the TMK parcel; and is synonymous with the term "project area," which is bounded by N. King St., Pua Lane, Vineyard Blvd., and Liliha St. in Honolulu (**Figure 1** and **Figure 2**). The APE/project area is located in a thoroughly urbanized/developed part of Honolulu: Iwilei is located just makai (seaward) of the project area; Kalihi and Kapālama are to the 'ewa (west) side; Nu'uanu and Chinatown are located to the northeast and southeast, respectively.

The purpose of this consultation letter is (1) to provide notification that this project could affect historic properties of interest to you; (2) to seek your views on the methods by which we will identify and evaluate historic properties in the project area; and (3) to solicit your views on the proposed undertaking's potential effects on historic properties.

We also seek your input as to other interested parties with whom you believe we should be consulting. At the end of this letter, we list other organizations and individuals with whom we have also initiated consultation for this proposed undertaking.

This letter represents only the start of our formal consultation efforts with you. We will continue to consult, formally as well as informally, throughout the entire process of conducting our AIS and CIA investigations; and we will continue to seek your views on the identification of historic properties, their evaluation, and mitigation of any adverse effects.

Proposed Undertaking

Mayor Wright Homes (public housing complex built by the HPHA) were first occupied in 1952 or 1953 (depending on the source), making them some 63 or 64 years old.[1] The proposed undertaking will replace the existing 364 residential units—currently consisting of 35 separate, low-rise buildings (plus an administration building)—with 1,000–1,500 residential units and other mixed-use structures; the new development will include low, medium and high-rise buildings. This project is considered to be part of the Transit-Oriented Development (TOD) associated with construction of the Honolulu Rail Transit Project.

Cultural and Historical Background

The entire project area is more or less full of Land Commission Awards (LCAw), or kuleana parcels, dating from the middle-nineteenth century legal process of land division and private ownership known as the Māhele.[2] There are more than two dozen LCAs wholly or partially within the project area, or immediately adjacent to its boundaries (**Figure 3**). Preliminary analysis of these records indicates the project area represented prime, irrigated taro lands in or immediately adjacent to the lower floodplain of Nu'uanu Stream, with traditional irrigation ditches ('auwai) and scattered house sites dotting the landscape.

A Hawaiian Kingdom government survey map from 1887 depicts a large residential structure labelled "R. Keliiokolani" (i.e., Princess Ruth Ke'elikōlani) in the southwest corner of the project area, but no other structures; the 1906 series of Dakin Fire Insurance maps shows many structures throughout most of the project area with the vast majority labelled as "dwellings" or "tenements." Interestingly, much of the eastern quadrant of the project area was still being used to grow taro and other plants. A tofu-making operation was located along Pua Lane. A "Japanese hotel" and several horse stables and facilities were also scattered about the project area.

These and other historical maps and documentation indicate the project area has been heavily developed/urbanized for over 100 years; before this, in the nineteenth century and in "precontact" times, the project area was full of traditional Hawaiian lo'i kalo (irrigated taro gardens). At least some small house sites were also located in the project area. It is unlikely that the project area would have been used for burials prior to the historic period. These were prime agricultural lands. However, following the social disruptions caused by the arrival of Americans, Euroamericans and Europeans around 1800 and increasingly in the early nineteenth century, burial practices may have changed as traditional access to the entire ahupua'a was cut off. Thus, it is possible that some "backyard burials" may have taken place in the nineteenth century in the project area.

Previous and Proposed Cultural Resource Evaluations in the Project Area

To the best of our knowledge, there have not been any formal archaeological surveys or cultural resources assessments in the project area, since the existing Mayor Wright Homes was completed prior to the introduction of environmental and historic-preservation laws (starting in the 1960s).

Our AIS will be conducted in accordance with Hawai'i Administrative Rules (HAR) § 13-276; we will consult with the SHPD to develop an appropriate scope of work to ensure all historic properties are identified. Our CIA will be conducted in accordance with Hawai'i Revised Statutes (HRS) § 343 and HAR § 11-200, as well as the State Office of Environmental Quality Control's (OEQC) 2012 *Guide to the Implementation and Practice of the Hawaii Environmental Policy Act*.

[1] The above-ground, architectural structures in the APE/project area are being evaluated by Fung Associates, Inc.
[2] The areas on the 1939 map where there are no LCAs depicted, but where Land Court Application numbers appear, conceal still more LCAs that will be documented and analyzed in our investigations.

Consultation Process for this Project to Date

In addition to your agency, we have also initiated formal consultation efforts with the following individuals and organizations:

- State Historic Preservation Division, Department of Land and Natural Resources
- O'ahu Island Burial Council
- Ms. Paulette Kaanohiokalani Kalcikini
- Ms. Cynthia B. Yoshida (Public Housing Supervisor at Mayor Wright Homes)
- Kalihi-Palama Hawaiian Civic Club
- Kalihi-Palama Neighborhood Board (No. 15)

If you know of other individuals or organizations with whom you believe we should consult, we request that you kindly share this information with us.

Please feel free to contact me via email, regular mail or phone if you have any questions about this consultation letter.

With aloha,

Christopher M. Monahan, Ph.D.

SECTION 106 CONSULTATION
MAYOR WRIGHT HOMES REDEVELOPMENT
DISTRICT OF KONA, OAHU, HONOLULU AHUPUA'A
TAX MAP KEY (TMK): (1) 1-7-029: 003

Aloha Mr. Kai,

The Hawai'i Public Housing Authority ("HPHA") is evaluating the potential redevelopment of the Mayor Wright Homes public housing development located at 521 North Kukui Street, District of Kona, Oahu, Honolulu Ahupua'a, Tax Map Key ("TMK") (1) 1-7-029:003 ("Site"). The overall redevelopment program would include applying to the U.S. Department of Housing and Urban Development ("HUD") to raze the existing structures and redevelop the site as a mixed-income, mixed-use housing development ("Project"). The proposed Project will total approximately 2,448 residential rental units; approximately two-thirds of which shall be affordable units, including the replacement of the existing 364 public housing units on site, on a one-for-one basis, with similarly deeply subsidized units. In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

The Mayor Wright Homes redevelopment will not only improve housing conditions for our current tenants, but will fundamentally transform an existing, six-decade old, state-owned land asset, into a new, mixed-income, mixed-use, transit oriented development enhancing the existing vibrant Kalihi, Liliha, Kapālama, and Iwilei communities. As the Project's residential units will be 100% rental, the Project will facilitate the delivery of urgently needed new rental housing units to help address the existing affordable rental housing crisis across the State of Hawai'i. The HPHA has entered into a public/private partnership with MWH Partners, LLC, its affiliates and consultants ("Development Team") to execute the Project.

HPHA is evaluating utilizing available funding pursuant to the Housing Act of 1937, as amended, to assist in the construction of Replacement Units and to contribute toward the

In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

The Mayor Wright Homes redevelopment will not only improve housing conditions for our current tenants, but will fundamentally transform an existing, six-decade old, state-owned land asset, into a new, mixed-income, mixed-use, transit oriented development enhancing the existing vibrant Kalihi, Liliha, Kapālama, and Iwilei communities. As the Project's residential units will be 100% rental, the Project will facilitate the delivery of urgently needed new rental housing units to help address the existing affordable rental housing crisis across the State of Hawai'i. The HPHA has entered into a public/private partnership with MWH Partners, LLC, its affiliates and consultants ("Development Team") to execute the Project.

HPHA is evaluating utilizing available funding pursuant to the Housing Act of 1937, as amended, to assist in the construction of Replacement Units and to contribute toward the

TAX MAP KEY (TMK): (1) 1-7-029: 003

Aloha Ms. Sterling,

The Hawai'i Public Housing Authority ("HPHA") is evaluating the potential redevelopment of the Mayor Wright Homes public housing development located at 521 North Kukui Street, District of Kona, Oahu, Honolulu Ahupua'a, Tax Map Key ("TMK") (1) 1-7-029:003 ("Site"). The overall redevelopment program would include applying to the U.S. Department of Housing and Urban Development ("HUD") to raze the existing structures and redevelop the site as a mixed-income, mixed-use housing development ("Project"). The proposed Project will total approximately 2,448 residential rental units; approximately two-thirds of which shall be affordable units, including the replacement of the existing 364 public housing units on site, on a one-for-one basis, with similarly deeply subsidized units. In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

The Mayor Wright Homes redevelopment will not only improve housing conditions for our current tenants, but will fundamentally transform an existing, six-decade old, state-owned land asset, into a new, mixed-income, mixed-use, transit oriented development enhancing the existing vibrant Kalihi, Liliha, Kapālama, and Iwilei communities. SECTION 106 CONSULTATION
MAYOR WRIGHT HOMES REDEVELOPMENT
DISTRICT OF KONA, OAHU, HONOLULU AHUPUAʻA
TAX MAP KEY (TMK): (1) 1-7-029: 003

Aloha Mr. de Alba Chu,

The Hawaiʻi Public Housing Authority (“HPHA”) is evaluating the potential redevelopment of the Mayor Wright Homes public housing development located at 521 North Kukui Street, District of Kona, Oahu, Honolulu Ahupuaʻa, Tax Map Key (“TMK”) (1) 1-7-029:003 (“Site”). The overall redevelopment program would include applying to the U.S. Department of Housing and Urban Development (“HUD”) to raze the existing structures and redevelop the site as a mixed-income, mixed-use housing development (“Project”). The proposed Project will total approximately 2,448 residential rental units; approximately two-thirds of which shall be affordable units, including the replacement of the existing 364 public housing units on site, on a one-for-one basis, with similarly deeply subsidized units. In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

The Mayor Wright Homes redevelopment will not only improve housing conditions for our current tenants, but will fundamentally transform an existing, six-decade old, state-owned land asset, into a new, mixed-income, mixed-use, transit oriented development enhancing the existing vibrant Kalihi, Liliha, Kapālama, and Iwilei communities. As the Project’s residential units will be 100% rental, the Project will facilitate the delivery of urgently needed new rental housing units to help address the existing affordable rental housing crisis across the State of Hawaiʻi. The HPHA has entered into a public/private partnership with MWH Partners, LLC, its affiliates and consultants (“Development Team”) to execute the Project.

HPHA is evaluating utilizing available funding pursuant to the Housing Act of 1937, as amended, to assist in the construction of Replacement Units and to contribute toward the

Ms. Michelle Malia Hiraishi
Hui Mālama Ola Nā ʻŌiwi
69 Railroad Ave., Suite A-3
Hilo, HI 96720

SUBJECT: NATIONAL HISTORIC PRESERVATION ACT
SECTION 106 CONSULTATION
MAYOR WRIGHT HOMES REDEVELOPMENT
DISTRICT OF KONA, OAHU, HONOLULU AHUPUAʻA
TAX MAP KEY (TMK): (1) 1-7-029: 003

Aloha Ms. Hiraishi,

The Hawai'i Public Housing Authority ("HPHA") is evaluating the potential redevelopment of the Mayor Wright Homes public housing development located at 521 North Kukui Street, District of Kona, Oahu, Honolulu Ahupua'a, Tax Map Key ("TMK") (1) 1-7-029:003 ("Site"). The overall redevelopment program would include applying to the U.S. Department of Housing and Urban Development ("HUD") to raze the existing structures and redevelop the site as a mixed-income, mixed-use housing development ("Project"). The proposed Project will total approximately 2,448 residential rental units; approximately two-thirds of which shall be affordable units, including the replacement of the existing 364 public housing units on site, on a one-for-one basis, with similarly deeply subsidized units. In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

The Mayor Wright Homes redevelopment will not only improve housing conditions for our current tenants, but will fundamentally transform an existing, six-decade old, state-owned land asset, into a new, mixed-income, mixed-use, transit oriented development enhancing the existing vibrant Kalihi, Liliha, Kapālama, and Iwilei communities. As the Project's residential units will be 100% rental, the Project will facilitate the delivery of urgently needed new rental housing units to help address the existing affordable rental housing crisis across the State of Hawai'i. The HPHA has entered into a public/private partnership with MWH Partners, LLC, its affiliates and consultants ("Development Team") to execute the Project.

HPHA is evaluating utilizing available funding pursuant to the Housing Act of 1937, as amended, to assist in the construction of Replacement Units and to contribute toward the

TAX MAP KEY (TMK): (1) 1-7-029: 003

Aloha Ms. Johnson,

The Hawaiʻi Public Housing Authority (“HPHA”) is evaluating the potential redevelopment of the Mayor Wright Homes public housing development located at 521 North Kukui Street, District of Kona, Oahu, Honolulu Ahupuaʻa, Tax Map Key (“TMK”) (1) 1-7-029:003 (“Site”). The overall redevelopment program would include applying to the U.S. Department of Housing and Urban Development (“HUD”) to raze the existing structures and redevelop the site as a mixed-income, mixed-use housing development (“Project”). The proposed Project will total approximately 2,448 residential rental units; approximately two-thirds of which shall be affordable units, including the replacement of the existing 364 public housing units on site, on a one-for-one basis, with similarly deeply subsidized units. In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

The Mayor Wright Homes redevelopment will not only improve housing conditions for our current tenants, but will fundamentally transform an existing, six-decade old, state-owned land asset, into a new, mixed-income, mixed-use, transit oriented development enhancing the existing vibrant Kalihi, Liliha, Kapālama, and Iwilei communities. As the Project’s residential units will be 100% rental, the Project will facilitate the delivery of urgently needed new rental housing units to help address the existing affordable rental housing crisis across the State of Hawaiʻi. The HPHA has entered into a public/private partnership with MWH Partners, LLC, its affiliates and consultants (“Development Team”) to execute the Project.

HPHA is evaluating utilizing available funding pursuant to the Housing Act of 1937, as amended, to assist in the construction of Replacement Units and to contribute toward the

The Hawai'i Public Housing Authority ("HPHA") is evaluating the potential redevelopment of the Mayor Wright Homes public housing development located at 521 North Kukui Street, District of Kona, Oahu, Honolulu Ahupua'a, Tax Map Key ("TMK") (1) 1-7-029:003 ("Site"). The overall redevelopment program would include applying to the U.S. Department of Housing and Urban Development ("HUD") to raze the existing structures and redevelop the site as a mixed-income, mixed-use housing development ("Project"). The proposed Project will total approximately 2,448 residential rental units; approximately two-thirds of which shall be affordable units, including the replacement of the existing 364 public housing units on site, on a one-for-one basis, with similarly deeply subsidized units. In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

The Mayor Wright Homes redevelopment will not only improve housing conditions for our current tenants, but will fundamentally transform an existing, six-decade old, state-owned land asset, into a new, mixed-income, mixed-use, transit oriented development enhancing the existing vibrant Kalihi, Liliha, Kapālama, and Iwilei communities. As the Project's residential units will be 100% rental, the Project will facilitate the delivery of urgently needed new rental housing units to help address the existing affordable rental housing crisis across the State of Hawai'i. The HPHA has entered into a public/private partnership with MWH Partners, LLC, its affiliates and consultants ("Development Team") to execute the Project.

HPHA is evaluating utilizing available funding pursuant to the Housing Act of 1937, as amended, to assist in the construction of Replacement Units and to contribute toward the

The overall redevelopment program would include applying to the U.S. Department of Housing and Urban Development ("HUD") to raze the existing structures and redevelop the site as a mixed-income, mixed-use housing development ("Project"). The proposed Project will total approximately 2,448 residential rental units; approximately two-thirds of which shall be affordable units, including the replacement of the existing 364 public housing units on site, on a one-for-one basis, with similarly deeply subsidized units. In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

The Mayor Wright Homes redevelopment will not only improve housing conditions for our current tenants, but will fundamentally transform an existing, six-decade old, state-owned land asset, into a new, mixed-income, mixed-use, transit oriented development enhancing the existing vibrant Kalihi, Liliha, Kapālama, and Iwilei communities. As the Project's residential units will be 100% rental, the Project will facilitate the delivery of urgently needed new rental housing units to help address the existing affordable rental housing crisis across the State of Hawai'i. The HPHA has entered into a public/private partnership with MWH Partners, LLC, its affiliates and consultants ("Development Team") to execute the Project.

HPHA is evaluating utilizing available funding pursuant to the Housing Act of 1937, as amended, to assist in the construction of Replacement Units and to contribute toward the

The proposed Project will total approximately 2,448 residential rental units; approximately two-thirds of which shall be affordable units, including the replacement of the existing 364 public housing units on site, on a one-for-one basis, with similarly deeply subsidized units. In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

The Mayor Wright Homes redevelopment will not only improve housing conditions for our current tenants, but will fundamentally transform an existing, six-decade old, state-owned land asset, into a new, mixed-income, mixed-use, transit oriented development enhancing the existing vibrant Kalihi, Liliha, Kapālama, and Iwilei communities. As the Project's residential units will be 100% rental, the Project will facilitate the delivery of urgently needed new rental housing units to help address the existing affordable rental housing crisis across the State of Hawai'i. The HPHA has entered into a public/private partnership with MWH Partners, LLC, its affiliates and consultants ("Development Team") to execute the Project.

HPHA is evaluating utilizing available funding pursuant to the Housing Act of 1937, as amended, to assist in the construction of Replacement Units and to contribute toward the

In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

The Mayor Wright Homes redevelopment will not only improve housing conditions for our current tenants, but will fundamentally transform an existing, six-decade old, state-owned land asset, into a new, mixed-income, mixed-use, transit oriented development enhancing the existing vibrant Kalihi, Liliha, Kapālama, and Iwilei communities. As the Project's residential units will be 100% rental, the Project will facilitate the delivery of urgently needed new rental housing units to help address the existing affordable rental housing crisis across the State of Hawai'i. The HPHA has entered into a public/private partnership with MWH Partners, LLC, its affiliates and consultants ("Development Team") to execute the Project.

HPHA is evaluating utilizing available funding pursuant to the Housing Act of 1937, as amended, to assist in the construction of Replacement Units and to contribute toward the

SECTION 106 CONSULTATION
MAYOR WRIGHT HOMES REDEVELOPMENT
DISTRICT OF KONA, OAHU, HONOLULU AHUPUA'A
TAX MAP KEY (TMK): (1) 1-7-029: 003

Aloha Mr. Richards,

The Hawai'i Public Housing Authority ("HPHA") is evaluating the potential redevelopment of the Mayor Wright Homes public housing development located at 521 North Kukui Street, District of Kona, Oahu, Honolulu Ahupua'a, Tax Map Key ("TMK") (1) 1-7-029:003 ("Site"). The overall redevelopment program would include applying to the U.S. Department of Housing and Urban Development ("HUD") to raze the existing structures and redevelop the site as a mixed-income, mixed-use housing development ("Project"). The proposed Project will total approximately 2,448 residential rental units; approximately two-thirds of which shall be affordable units, including the replacement of the existing 364 public housing units on site, on a one-for-one basis, with similarly deeply subsidized units. In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

The Mayor Wright Homes redevelopment will not only improve housing conditions for our current tenants, but will fundamentally transform an existing, six-decade old, state-owned land asset, into a new, mixed-income, mixed-use, transit oriented development enhancing the existing vibrant Kalihi, Liliha, Kapālama, and Iwilei communities. As the Project's residential units will be 100% rental, the Project will facilitate the delivery of urgently needed new rental housing units to help address the existing affordable rental housing crisis across the State of Hawai'i. The HPHA has entered into a public/private partnership with MWH Partners, LLC, its affiliates and consultants ("Development Team") to execute the Project.

Honolulu, HI 96817

SUBJECT: NATIONAL HISTORIC PRESERVATION ACT
SECTION 106 CONSULTATION
MAYOR WRIGHT HOMES REDEVELOPMENT
DISTRICT OF KONA, OAHU, HONOLULU AHUPUA'A
TAX MAP KEY (TMK): (1) 1-7-029: 003

Aloha Chair Fong,

The Hawai'i Public Housing Authority ("HPHA") is evaluating the potential redevelopment of the Mayor Wright Homes public housing development located at 521 North Kukui Street, District of Kona, Oahu, Honolulu Ahupua'a, Tax Map Key ("TMK") (1) 1-7-029:003 ("Site"). The overall redevelopment program would include applying to the U.S. Department of Housing and Urban Development ("HUD") to raze the existing structures and redevelop the site as a mixed-income, mixed-use housing development ("Project"). The proposed Project will total approximately 2,448 residential rental units; approximately two-thirds of which shall be affordable units, including the replacement of the existing 364 public housing units on site, on a one-for-one basis, with similarly deeply subsidized units. In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

The Mayor Wright Homes redevelopment will not only improve housing conditions for our current tenants, but will fundamentally transform an existing, six-decade old, state-owned land asset, into a new, mixed-income, mixed-use, transit oriented development enhancing the existing vibrant Kalihi, Liliha, Kapālama, and Iwilei communities. As the Project's residential units will be 100% rental, the Project will facilitate the delivery of urgently needed new rental housing units to help address the existing affordable rental housing crisis across the State of Hawai'i. The HPHA has entered into a public/private partnership with MWH Partners, LLC, its affiliates and consultants ("Development Team") to execute the Project.

HPHA is evaluating utilizing available funding pursuant to the Housing Act of 1937, as amended, to assist in the construction of Replacement Units and to contribute toward the

operation of the Replacement Units with either public housing operating subsidy and/or project based vouchers. Because these proposed funding sources would include federal funding or grants, the proposed Project is considered a federal action or undertaking. Accordingly, it is required to comply with the National Environmental Policy Act ("NEPA") and the National Historic Preservation Act of 1966, as amended ("NHPA"), and other federal requirements ("Federal Requirements").

As it begins the process of complying with these Federal Requirements, and in accordance with implementing regulations at 36 CFR Part 800 ("Section 106 Regulations"), The HPHA is in the process of identifying organizations who may have an interest in the Project and its potential to affect historic properties, as well as Native Hawaiian Organizations and Native Hawaiian descendants who may have ancestral lineal or cultural ties, knowledge, or religious attachment to the Project site or concerns regarding the proposed Project ("Consulting Party" or "Consulting Parties"). The purpose of this letter is to invite your organization to be a Consulting Party for this Project pursuant to the rights and obligations conveyed to Consulting Parties under NHPA and Section 106 Regulations[1].

Based on the Development Team's analysis, site and area observations, consultation with the State Historic Preservation Division ("SHPD") and ongoing consultation with local community groups, the proposed Project will ultimately result in a determination of "adverse effect" with regard to historic architectural resources since the proposed Project will involve demolition of the existing buildings on the Project site, which themselves have been identified as a eligible for listing on a historic register (as further detailed in Attachment 1). The Development Team will continue to consult with the State Historic Preservation Officer ("SHPO") and other Consulting Parties to develop and evaluate alternatives or modifications to the Project that may avoid, minimize, or mitigate potential adverse effects on historic properties located in the area of the Project. If warranted, a Memorandum of Agreement ("MOA") may also be developed to identify mitigation commitments pertaining to historic architectural resources and resolve potential adverse effects to those resources through on-going consultation with Consulting Parties.

By becoming a Consulting Party, you will be actively engaging in the Section 106 process for the proposed Project. If you would like to request Consulting Party status for this Project, please contact Kimi Yuen at PBR Hawai'i at kyuen@pbrhawaii.com. If you are requesting Consulting Party status as an organization, we respectfully request that your organization nominate one representative and an alternate to participate on behalf of the group. Individuals may also participate in the Section 106 process as members of the public. We would appreciate a written response by August 17, 2018.

A summary of the Project, the environmental, cultural and historic review completed to date and remaining steps are described in Attachment 1 to this letter. We welcome any comments regarding this Project, the proposed improvements, its potential effects to

[1] The review process, known as Section 106 review, is described at https://www.onecpd.info/environmental-review/historic-preservation/ and at http://www.achp.gov/citizensguide.html

historic architectural resources, and any further observations regarding historic architectural, archaeological, cultural resources, religious attachment or other concerns you may have.

In addition to this letter of invitation, a Section 106 notice/advertisement shall also be published in *The Honolulu Star-Advertiser*. The advertisement shall also request a response within 30 days of the publication.

We look forward to working with you, your organization and the State Historic Preservation Division in completing the Section 106 review and moving forward with the development of the proposed Project and completing desperately needed housing units.

Again, please contact Kimi Yuen at PBR Hawai'i if you have any questions regarding this project.

Sincerely,

Hakim Ouansafi
Executive Director

Attachment 1: *Historic Review Summary and Description of Next Steps Mayor Wright Homes*

Attachment 1
Historic Review Summary and Description of Next Steps
Mayor Wright Homes

Introduction

The Hawai'i Public Housing Authority ("HPHA") is partnered with MWH Partners, LLC ("MHW Partners") a Delaware Limited Liability Company authorized to do business in the State of Hawaii, under a Master Development Agreement ("MDA") for the proposed redevelopment of the HPHA's Mayor Wright Homes, a 364-unit public housing development comprising a 14.8 Acres site located at 521 North Kukui Street Honolulu, Hawaii (TMK: 1-7-029:003) bounded by North King Street, Pua Lane, North Vineyard Boulevard, and Liliha Street.

The Mayor Wright Homes redevelopment project ("Project") will transform an existing state owned housing project into a new mixed-income, mixed-use transit oriented development ("TOD") that will be an integral part of the Kalihi-Pālama neighborhood. The proposed Project includes approximately 2,448 residential rental units; approximately two-thirds of which shall be affordable units. In addition, the Project shall include, at minimum, a one-for-one replacement of the existing 364 public housing units. Up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood. Open spaces are envisioned throughout including a new community center, parks, community gardens, and recreational decks. New internal streets will be designed in accordance with City and County of Honolulu Complete Streets Ordinance (Section 14-33, ROH) to support safe pedestrian and bicycle circulation and will also include traffic calming measures to slow vehicle traffic through the site. Convenient pedestrian and bicycle access will also be provided to the surrounding transit facilities. The HPHA is partnering with MWH Partners, LLC under a master development agreement to redevelop the property with the goals of improving housing conditions for the existing residents as well as increasing the amount of affordable housing provided in this critical TOD neighborhood.

The proposed Project is considered a federal action and undertaking and is, therefore, required to comply with the National Environmental Policy Act ("NEPA"), and the National Historic Preservation Act of 1966, as amended ("NHPA"), and other federal requirements ("Federal Requirements"). The Project Team is in the process of drafting an Environmental Assessment Determinations and Compliance Finding for HUD-assisted Projects as required pursuant to 24 CFR Part 58.36 and completing a NHPA Section 106 in accordance with implementing regulations at 36 CFR Part 800.

Preparation of an Environmental Impact Statement (EIS) is also required pursuant to Chapter 343, Hawai'i Revised Statutes and Chapter 200, Title 11, State of Hawai'i Department of Health Administrative Rules ("State EIS"). Section 343-5, HRS identifies nine types of actions that "trigger" compliance, which require either an Environmental Assessment or an EIS. The use of State or County funds and/or lands is one of these

"triggers." HPHA determined that an EIS (rather than an Environmental Assessment) was necessary based on a review of the significance criteria set forth under Section 11-200-12(b), HAR.

A State EIS for the Project was prepared by PBR Hawaii & Associates, Inc. and was preceded by the Mayor Wright Homes Redevelopment Environmental Impact Statement Preparation Notice ("EISPN"). HPHA submitted the EISPN to the State of Hawai'i Office of Environmental Quality Control ("OEQC") on September 13, 2016. Notice of the availability of the EISPN was published in the September 23, 2016 edition of the OEQC's Environmental Notice, and was also posted on the OEQC website. Copies of the EISPN were provided to various government agencies, elected officials, utilities, regional public libraries, media outlets, and other individuals and community organizations. The public comment period for the EISPN began on September 23, 2016 and ended on October 24, 2016. Comments received during the public comment period on the EISPN and the respective responses were incorporated in a Draft EIS.

HPHA submitted the Draft EIS to OEQC on August 28, 2017 and Notice of the availability of the Draft EIS was published in the September 8, 2017 edition of OEQC's The Environmental Notice. Copies of the Draft EIS were provided to appropriate government agencies, (including DPP, DTS, OP, DAGS, DLNR, HFD, DOE, HPD, DHS, etc.) as well as elected officials, utilities, regional public libraries, media outlets, and other individuals and community organizations. The official 45-day public comment period on the Draft EIS began on September 8, 2017 and ended on October 23, 2017. Comments to the Draft EIS received during the public comment period and responses to the comments were incorporated into a final EIS ("FEIS")

The information contained in the FEIS was developed from site visits, generally available information regarding the characteristics of the proposed Project site and surrounding areas, information and input gathered during the master planning process, and technical studies prepared for the Project. The following is a list of the technical reports and studies prepared for the Project and attached as appendices to the FEIS.

- Biological Resources Survey
- Archaeological Inventory Survey
- Identification of Historic Properties Reconnaissance-Level Survey
- Cultural Impact Assessment
- Socio-Economic Impact Assessment
- Noise and Vibration Study
- Air Quality Study
- Preliminary Engineering Report
- Transportation Impact Analysis Report
- Phase I Environmental Site Assessment
- Human Capital Report
- Housing Market Study

HPHA's Board of Directors accepted/approved the FEIS and On February 15, 2018, authorizing HPHA's Executive Director to submit the State FEIS to the Governor's office for review and approval as the Accepting Authority for as required under Section 11-200-23, Hawai'i Administrative Rules (HAR). This submission was completed on Monday February 26, 2018.

The Governor accepted the State FEIS on April 24, 2018[2].

Project Overview

Named for George F. Wright, the seventh mayor of Honolulu, Mayor Wright Homes is a federally funded low-income housing project that is owned and operated by the HPHA. The property is located at North Kukui Street on the island of O'ahu in the State of Hawai'i and consists of a single 14.8-acre land parcel identified as TMK: 1-7-029:003. The property site is bound by four existing roadways: North King Street, Pua Lane, North Vineyard Boulevard, and Liliha Street. It is improved with 35 two-story and three-story walk-up buildings containing a total of 364 low-income rental units providing housing for approximately 1,500 residents. The property is currently subject to a Declaration of Trust with the U.S. Department of Housing and Urban Development ("HUD") and has been used for public housing since its construction in 1953. Although the property was recently upgraded in 1984, the existing units are functionally obsolete and have outlasted their useful life.

The HPHA is the proposing Agency for the Project. HPHA is a public body and a body corporate and politic of the State of Hawai'i established by the Territory of Hawai'i in 1935. HPHA's primary mission is to provide safe, decent, and sanitary housing for low-income residents of the State of Hawai'i. HPHA is governed by the Hawai'i State Legislature under Chapter 356D, Hawai'i Revised Statutes (HRS) and is the sole statewide public housing agency in the State of Hawai'i. Guided by an eleven-member Board of Directors appointed by the Governor, HPHA's efforts are focused on developing affordable rental and supportive housing, public housing and the efficient and fair delivery of housing services to the people of Hawai'i without discrimination. HPHA's Federal and State Low-Income Public Housing and rental assistance programs currently serve over 10,000 families, totaling more than 27,000 individuals.

The proposed master development plan for the Mayor Wright Homes redevelopment has evolved with extensive input from residents, community leaders and stakeholders, elected officials, government agencies, school officials, and service providers who participated in a series of community meetings held over several months starting in May 2016 and culminated in a week-long charrette held onsite in August 2016. It builds on research gathered on the property's historical, physical, social, and geographic context and

[2] Consultation to meet State of Hawai'i requirements for historic architectural resources is being carried out concurrently between the HPHA and the State Historic Preservation Division ("SHPD") under Chapter 6E of the Hawaii Revised Statutes.

technical information provided by consultants performing various site analyses. The proposed Project would involve the demolition of the existing buildings on the Site and redevelopment of the Site with residential uses including the Replacement Units, affordable and market rate units and non-residential uses. The proposed Project would also, include community facilities and commercial amenities, integrated into an overall mixed-use, mixed-income master development plan.

In addition to the minimum one-for-one replacement of the existing 364 public housing units currently available at the property, HPHA and its partner, MWH Partners, LLC, also propose to deliver up to 2,084 additional affordable and market rental housing units that can be offered to potential residents in a range of income levels. Approximately two-thirds of the total proposed units would be designated as long-term affordable housing targeted to residents earning up to 120 percent of the Area Median Income (AMI). In addition, up to 80,000 square feet of commercial space is also proposed as part of the Project which will include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood. A series of open spaces are envisioned throughout the re-designed site including a new community center and park.

The redevelopment of Mayor Wright Homes is envisioned as a catalytic project with the potential to transform an existing, obsolete, state-owned land asset, into a new, mixed-income, mixed-use, transit oriented development designed to complement the existing vibrant Kalihi, Liliha, Kapālama, and Iwilei communities. While providing vastly improved housing conditions for its current residents, the proposed Project will also deliver desperately needed new rental housing units within Downtown Honolulu's Primary Urban Center. The property is well located nearby existing employment centers, easily accessible by public transit, and within walking distance of the future Iwilei rail station of the Honolulu Light Rail System currently being developed by The Honolulu Authority for Rapid Transportation.

Project Need and Positive Impacts

The State of Hawai'i and City and County of Honolulu are currently experiencing a housing crisis. Due to an increasingly high demand for housing, coupled with a decades-low new housing supply, limited land, and high production costs, Honolulu consistently ranks among the most expensive residential rental markets in the nation. As housing costs in Hawai'i continue to increase, the number of available affordable apartments continues to decline leaving low to moderate-income households with limited housing options. Consequently, many of these households are forced to relocate greater distances from their place of work in urban Honolulu, resulting in secondary impacts such as lengthening commute times, exacerbating traffic congestion, increasing pollution, social and environmental impacts associated with traffic congestion and a decreasing quality of life for commuters. In a worst-case scenario, many of these residents may be displaced altogether.

On June 29, 2016, SB2561, SD2, HD1, CD1, was signed into law as Act 127 (the ACT), Session Laws of Hawai'i (SLH), to address the affordable rental housing crisis by establishing an affordable rental housing goal, and a Special Action Team on affordable rental housing (SAT). The SAT is chaired by the Director of the State Office of Planning (OP) and its mission is to recommend actions to promote affordable rental housing. The primary goal of the ACT is to develop or vest the development of at least 22,500 affordable rental housing units, ready for occupancy, between January 1, 2017 and December 31, 2026.

According to the "Special Action Team on Affordable Rental Housing Report to the Hawai'i State Legislature in Response to Act 127, Session Laws of Hawai'i 2016" (State of Hawaii Office of Planning, 2016):

> *Housing is considered "affordable" when a household spends less than 30 percent of their income on shelter and utilities. But affordable housing is a serious challenge for Hawai'i's low-income residents, who face one of the highest housing cost in the country. In a market with some of the most expensive for-sale homes in the county, 43% of the state's households must rent. This is even more difficult for Hawai'i's residents as rent increases, but wages have not kept pace. There is a sense of urgency in developing needed rental housing units, particularly for households in the rental housing "gap" group (i.e., those earning between 60% and 80% of the area median income (AMI)). The need for affordable housing is particularly acute for households with low incomes.*

The proposed Project specifically responds to this urgent need for affordable rental housing and is an excellent candidate for redevelopment for the following reasons:

(i) The proposed Project is ideally located in the Honolulu's Primary Urban Center, close to existing employment centers, infrastructure, and transportation networks, which is highly consistent with the City and County of Honolulu's General Plan.

(ii) The Honolulu City Council recently adopted the Downtown Neighborhood TOD Plan on September 6, 2017 as City Council Resolution No. 16-247, CD1, FD1 permitting building heights up to 400 feet and a FAR up to 7.5 for the proposed Project site.

(iii) The overall intensification of land uses within the Kalihi-Kapālama-Iwilei corridor is a major goal of the City of Honolulu's long-range vision and general development pattern goals which emphasize the need for the existing urban core around Honolulu to remain O'ahu's primary urban center.

(iv) The proposed Project will reduce the pressure to develop in more rural areas that may be more adversely impacted by a project of similar scale and which may not have sufficient infrastructure, utilities, or access to transportation networks.

(v) The proposed Project is well serviced by O'ahu's existing bus transit system. It is also located less than a third-of-a-mile from the planned Iwilei Transit Station of the Honolulu Light Rail Transit Project and has been designed with thoughtful consideration to equitable Transit Oriented Development (TOD) design principles and may contribute to reductions in impacts such as traffic and related fuel consumption and air pollution.

(vi) The conceptual master plan for the proposed Project has been designed in accordance with City and County of Honolulu Complete Streets Ordinance (Section 14-33, ROH) and envisions incorporating retail and commercial uses at street level of the new buildings, complimenting existing area uses, and providing necessary services for area residents.

(vii) The proposed Project is expected to result in a reinvigorated community with well-connected thoroughfares together with interconnected and activated streets that will encourage walking and biking, which in turn support community safety.

(viii) The proposed Project incorporates well designed recreational spaces combined with green building and sustainability concepts that will contribute to improved individual health, wellbeing, quality of life and sense of connectedness for existing and future residents.

(ix) The proposed Project represents the efficient use of public resources by leveraging both private and public funding to redevelop an existing urbanized site.

(x) The proposed Project attempts to balance the potential impacts of intensification of use onsite with the social and environmental considerations of creating a high-quality, comfortable, and inviting community to live, work, and play with the potential for far-reaching transformative positive community impacts well beyond the boundaries of the project site.

Section 106 Consultation

Working with the SHPD, the Development Team has already identified several organizations with an interest in the Project and its potential to affect historic properties. The Development Team has conducted several rounds of outreach for public participation in the project Project to date. The majority of this previous outreach has focused on archaeological and cultural historic properties, as summarized here; notification of additional architectural historic properties that may be affected is also included in this summary.

An Architectural Area of Potential Effect ("APE") was determined through early consultation with the State Historic Preservation Division ("SHPD"), in accordance with ("NHPA") and Section 106 Regulations. The Architectural APE measures approximately 100 acres of land surrounding the Site and encompasses portions of TMKs: (1) 1-5-005;

1-5-006; 1-5-007; 1-5-017; 1-6-001; 1-7-023; 1-7-026; 1-7-027; 1-7-029; 1-7-031; 1-7-032; 1-7-033; and 1-7:045. The large survey boundary surrounding the Site was designed to include all architectural properties that could be affected by the redevelopment Project in the absence of a final design. In a letter dated June 20, 2017, SHPD concurred with the survey strategy for historic resources and requested a subsequent Reconnaissance Level Survey (RLS) for architectural resources within the approved Architectural APE, see Tab 3.

Section 106 consultation review of the site's archaeological and cultural resources was performed by TCP Hawaii, LLC ("TCP"). It also references an Archaeological APE, which is equivalent to the 14.8-acre Project area, and is identified within the Archaeological Inventory Survey (AIS).

Attached to this summary are the following materials to provide context concerning the proposed Project Site, its history, and consultation concerning the undertaking engaged to date.

Tab 1- Tax Map Key (TMK) map, site location map with photographs, and a map illustrating the Architectural Area of Potential Effect (APE)

Tab 2 - Site Photos
Tab 3 - Correspondence and Meeting Minutes
Tab 4 - Consultation List

Historical, Cultural, and Archaeological Background

A Cultural Impact Assessment ("CIA") together with an AIS, were prepared for the proposed Project by TCP in accordance with the Hawai'i Administrative Rules (HAR) 13-276 in 2017. Final revisions to the AIS report were submitted in 2018. No prior archaeological or cultural studies of the Archaeological APE had been completed prior to these studies, which yielded meaningful historical, cultural and archaeological background information about the Site.

The earliest documentary evidence of Hawaiians describing the Archaeological APE and its immediate environs, from the middle nineteenth-century Land Commission Awards, consistently refers to their lands as being in the 'āina of Honolulu (also known traditionally as Kou). It is likely, however, that the original inhabitants of O'ahu—prior to the invasions by Kahekili (Maui) starting in the late eighteenth century, and later by Kamehameha (Hawai'i Island)—would have referred to the Archaeological APE as Nu'uanu Ahupua'a, given its location in the flood plain of this stream. The earliest (1817) map by Otto von Kotzebue showing the Project area in some detail depicts the Project area as a dense cluster of lo'i kalo (irrigated taro) gardens. An 1855 map showing Honolulu harbor and environs by J.M.H. de La Passe shows the Archaeological APE as a dense cluster of lo'i kalo with scattered house sites here and there. Several fishponds—including Kuwila and Kawa—are located along the shoreline. By this (middle nineteenth-century) time, the

main town of Honolulu was still on the other (east) side of Nu'uanu Stream (in what would eventually become Chinatown). La Passe's (1855) map does show an old alignment of King Street passing just south of the Archaeological APE by this time. Liliha Street, bounding the Archaeological APE to the east, was described in the 1850s and 1860s as having lo'i terraces and pond fields in some places along its length.

Land Commission documents from the 1850s include at least five named 'ili in the Archaeological APE: Kapahaha, Kahawali (sometimes Kahawale), Koiuiu (at least once called "Koiuiu, Leleo"), Hauhaukoi, and Keoneula. Among the names of Hawaiians who were awarded parcels in the Archaeological APE, there is one Julia (or Juliana) Alapa'i Kauwa (or Kauwa'a), an ali'i nui (high chiefess), sometimes referred to as Princess and as konohiki by some claimants in the Archaeological APE (she married to the famous John Young, and died in 1849). Land uses described in these documents always refer to lo'i kalo with several house sites and occasional mentions of 'auwai (traditional irrigation ditch).

Later maps from the 1880s and 1890s show a large residence estate of Queen Lili'uokalani in the western corner of the Archaeological APE, which was at this time a kind of "suburban" Honolulu. The Queen's residence, which was named Mu'olaulani ("innumerable royal buds"), was an important center of activity for those resisting the U.S. takeover of Hawai'i (including Robert Wilcox). By the turn of the twentieth century, the Queen's former residence was used as a Japanese hotel (1901), then subdivided in 1906 into a series of "tenements" (rental apartments). A remnant portion of the original structure of Lili'uokalani's residence survived until the early 1950s (as depicted on a Sanborn fire insurance map), but was eventually demolished by 1953 to make way for the present Mayor Wright Homes.

Maps from 1906 and 1914 show a large soy factory (Hawaiian Soy Co., Ltd.) along Pua Lane, a small church (Palama Christian Church, in 1906, which had become an auto painting operation by 1914), laundries, a Japanese hotel, and small "factories" (to make candy and mattresses) along Liliha, and horse stables. A 1927 fire insurance map shows that residential structures (tenements) took over nearly the entire Archaeological APE with a few commercial operations remaining along Liliha and Pua Lane. A dance hall replaced the previous location of the auto painting structure, and a Filipino Missions and Social Club appeared in the corner parcel—just outside the Project area, at the intersection of Liliha and Vineyard. A 1947 map shows significant razing (demolition and removal) of structures throughout much of the Archaeological APE occurred, presumably as a precursor to the impending construction of Mayor Wright Homes.

In the late 1990s, the University of Hawai'i-Mānoa's Center for Oral History completed approximately 30 interviews with people who once lived or worked at Pālama Settlement. Many of those interviewed had specific knowledge of life and times at Mayor Wright Homes from as early as the 1960s. These recollections, along with interviews conducted for the CIA by TCP, paint a picture of Mayor Wright Homes as a place where people worked and lived together as a community, through good times and hard times, even though they were not necessarily well-to-do in a material sense. Most people looked back

to the 1970s and 1980s as the "golden era" of Mayor Wright Homes, where funding and programs to help people, particularly by including them in the neighboring Pālama Settlement activities.

Summary of Archaeological Sites within the Archaeological APE

An Archaeological Inventory Survey report by TCP was submitted to the State Historic Preservation Division on March 30, 2017. In a letter dated July 19, 2017 (Log No.: 2017.00597, Doc. No.: 1707KM03), the SHPD-Archaeology Branch reviewed the document for content and requested minor revisions. The revised report was submitted in May 23, 2018. Twenty-four (24) backhoe-assisted trenches were excavated, according to an SHPD-approved trenching plan. Four (4) historic properties were identified: SIHP # 50-80-14-8033, exposed in nearly all of the trenches (21 of 24), is a Project area wide grading/bulldozing and pit-filling (dumping) event that occurred just prior to, and in preparation for, the construction of the Mayor Wright Homes residential complex (circa 1952-3). Site 8034, exposed in several trenches in the mauka (inland) portion of the Project area (Trench #s 6, 7, 10, 15 & 17), is a subsurface layer consisting of gray clay interpreted as pond sediments, most likely the remnants of traditional Hawaiian lo'i kalo (irrigated, pond-field, taro cultivation).

Site 8035 consists of asphalt and/or concrete surfaces (exposed in Trench #11 [Feature 1] and Trench #12 [Feature 2], respectively) dating from the late historic/early modern period. Site 8036 is a set of very large drainage pipes (exposed in Trench #21) also dating from the late historic/early modern period. All four (4) identified historic properties are recommended significant per HAR § 13-13-275-6 under criterion d for their intrinsic informational value to research on the history and prehistory of Honolulu, its urbanization, and the advent of public housing in the State of Hawai'i, but all four (4) have also been determined to be not eligible for the National Register of Historic Places (NRHP). Under HRS § 6E, the TCP AIS Report recommended that the subject AIS had adequately identified historic properties within the open areas of the project area/direct APE based on all available archival information and archaeological testing.

Based on these same data, TCP concluded that there is a moderate likelihood of encountering additional historic properties, similar to the ones already documented in the AIS, under some of the current (extant) buildings. For these reasons, under HRS § 6E, TCP recommend the project effect determination (HAR § 13-13-275-7) would be "effect, with proposed mitigation commitments," and we recommend the proposed mitigation is data recovery in the form of archaeological monitoring in accordance with HAR § 13-13-279. In this way, additional data may be obtained from the four (4) identified historic properties in the open areas of the project area/direct APE, and, if present, from beneath the current (extant) buildings during demolition and construction. Under Section 106 (36 CFR Part 800.5), because the four (4) sites have been determined to be not eligible for the NRHP, the effect determination is "no historic properties affected."

Summary of Historic Architectural Properties within the Architectural APE

In 2017 and in accordance with the Hawai'i Administrative Rules (HAR) 13-275, Fung Associates, Inc. conducted an architectural Reconnaissance Level Survey ("RLS") of all properties within the Architectural APE built prior to 1977 Don Hibbard, Alison Chiu, and Anna Broverman of Fung Associates, Inc. completed the pedestrian field survey and prepared the RLS forms. Hibbard, Chiu and Broverman each meet the Secretary of the Interior's (SOI) Qualification Standards for architectural historians, per 36 CFR 61.

Properties constructed between 1967 and 1977 were included in the RLS due to the anticipated length of the Project, and the objective of the RLS was to ascertain whether any possible historic properties were located in the Architectural APE. Some properties that are not yet historic, but are anticipated to be eligible once they meet the 50-year requirement, were also included in the RLS. The Mayor Wright Homes site, itself, was identified as eligible for listing on a historic register under Criterion A for its association with the development of public housing in Hawai'i.

Of the 161 properties examined and included in the RLS only two are presently listed in either the Hawaii or National Registers of Historic Places. Forty-seven properties appear to meet the criteria for listing in the Hawaii and National Registers for their associations with the architectural traditions of Hawaii; of these properties, 6 are already identified in the Statewide Inventory of Historic Places (SIHP). An additional 13 properties were determined potentially eligible once they meet the 50-year age requirement. The other 83 properties do not appear to meet the criteria for listing in either historic register because their historic integrity has been compromised. There are 4 properties that were determined ineligible as individual properties, but they are eligible as contributing features to a historic district. Unknown determinations were given to 13 properties not visible from public right of ways.

Two possible historic districts were identified within the Architectural APE: 1) a potential historic district comprised of small scale, commercial properties along Liliha Street, from the mid-century era, and 2) a potential historic district comprised of the Kauluwela Redevelopment Area, which reflects design and construction efforts of the Honolulu Redevelopment Agency (HRA) spanning the 1960s and 1970s period.

The SHPD accepted the findings of the RLS on August 25, 2017, see Tab 3.

Completed Consultations for Archaeological and Cultural Resources

The Development Team previously initiated limited consultation during the development of the CIA, with TCP writing a letter to SHPD regarding the Project in May 2016, and participation in several rounds of public meetings and outreach for the proposed Project including resident and community meetings, area Neighborhood Board meetings, and a week-long conceptual design charrette at the Site. In addition, the Development Team has met with various stakeholders including area legislators and councilmembers,

businesses, schools, churches, public agencies, and service providers to discuss their suggestions and concerns regarding the proposed Project.

Architectural pre-consultation to satisfy State Historic Preservation Division requirements (HRS 6E-8) for the Project was initiated early in the process of evaluating architectural alternatives. The Development Team met with SHPD-Architecture branch staff along with staff from Historic Hawai'i Foundation, to discuss the nature of the existing structure and the considered alternatives for rehabilitation or replacement. Notes from this January 25, 2017 meeting are enclosed, see Tab 3.

As a part of CIA consultation, from the end of May to early June, 2016, TCP sent formal Section 106 and Chapter 6E consultation letters to the following agencies and individuals:

1. SHPD/DLNR (Administrator Downer, Archaeology Branch Chief Susan Lebo, O'ahu Burial Site Program staff Regina Hilo, and Ka'āhiki Solis);
2. OHA (Ka Pouhana/CEO Crabbe and staff in Compliance, Kai Markell and Lauren Morawski);
3. Kalihi-Palama Neighborhood Board (Chair Ryan Mandado);
4. Kalihi-Palama Hawaiian Civic Club (Pelekikena/President Leimomi Khan);
5. Cynthia Yoshida (Public Housing Supervisor, Mayor Wright Homes);
6. Historic Hawai'i Foundation (Kiersten Faulkner, Executive Director);
7. Ka'anohi Paulette Kaleikini (Native Hawaiian, cultural descendant, Honolulu area);
8. Michael Lee (Native Hawaiian, cultural descendant, Honolulu area).

Representatives of TCP and MWH Partners, LLC provided the O'ahu Island Burial Council with an informational presentation about the proposed CIA in June 2016, .

Ka'anohi Kaleikini and TCP exchanged emails in May-June, 2016, regarding her consultation input. Her primary input was to bring attention to the nearby, recent AIS at the American Savings Bank property where burials were identified; and to raise the issue of possibly including cultural monitoring on the AIS.

OHA replied in writing on June 28, 2016, to the formal consultation letter. TCP also communicated informally by phone in June 2016, with OHA Compliance staff, Kai Markell and Lauren Morawski, to notify them about the proposed AIS.

TCP met formally with Dr. Susan Lebo, in June 2016, about the proposed AIS who suggested TCP reach out to SHPD staff, Ka'āhiki Solis, History and Culture Branch, regarding information about the Site, and, specifically, the proposed CIA. TCP contacted Ka'āhiki Solis via email on June 3, 2016, and again in September 2016.

From the end of May to early June 2016, TCP sent Section 106 and HRS 6E-8 consultation letters regarding the (then) proposed Archaeological Inventory Survey to the following agencies and individuals:

1. SHPD/DLNR - Administrator Downer, Archaeology Branch Chief Susan Lebo, O'ahu Burial Site Program staff Regina Hilo, and Ka'āhiki Solis;
2. Office of Hawaiian Affairs ("OHA") - Ka Pouhana/CEO Crabbe and staff in Compliance, Kai Markell and Lauren Morawski;
3. Kalihi-Palama Neighborhood Board -Chair Ryan Mandado;
4. Kalihi-Palama Hawaiian Civic Club -Pelekikena/President Leimomi Khan;
5. Cynthia Yoshida -Public Housing Supervisor, Mayor Wright Homes;
6. Historic Hawai'i Foundation - Kiersten Faulkner, Executive Director;
7. Ka'anohi Paulette Kaleikini -Native Hawaiian, cultural descendant, Honolulu area; and
8. Michael Lee - Native Hawaiian, cultural descendant, Honolulu area.

Section 106 Next Steps – Resolving Adverse Effects

Based on its collective analysis, site observations, consultation with the SHPD and ongoing consultation with community groups, the proposed Project will ultimately result in a determination of "adverse effect" pursuant to Section 106 Regulations (36 CFR Part 800.5) for historic architectural properties, since the proposed Project will involve demolition of the existing buildings on the Site, which themselves have been identified as an eligible for listing on a historic register. HPHA and the Development team will continue to consult with the SHPD and other Consulting Parties to seek ways to avoid, minimize or mitigate the adverse effects historic architectural resources and, if required, the HPHA, the SHPO, and consulting parties may execute a memorandum of agreement ("MOA") defining such mitigation commitments.

Dear Mr. Ouansafi:

RE: National Historic Preservation Act Section 106 Cultural Resources Management Consultation and Hawaii Revised Statutes Chapter 6E-8 Historic Preservation Review
Agency: Department of Human Services, Hawaii Public Housing Authority (DHS)
Mayor Wright Homes Redevelopment
TMK: (1)1-7-029:003

Thank you for the opportunity to comment on this request from Hawaii Public Housing Authority, Department of Humans Services (DHS) for consultation and concurrence with the proposed area of potential effect (APE) for the proposed Mayor Wright Homes Redevelopment project. DHS has identified that this project is subject to historic preservation review, pursuant to Hawaii Revised Statutes (HRS) Chapter 6E-8. The proposed project may also be an undertaking, as defined at 36 § CFR 800. DHS anticipates project funds will include Part 58 funds for low-income public housing. The State Historic Preservation Division (SHPD) received this submittal on May 25, 2017.

The proposed APE includes the area within the general boundaries of Austin Lane to the north, Lunalilo Freeway to the east, River Street to the south, and Dillingham Boulevard and Iwilei Road to the west. This boundary includes the physical footprint of the TMK parcel for Mayer Wright Housing, as well as several notable and historic adjacent community resources. SHPD has reviewed and **concurs** with the above cited APE. SHPD looks forward to reviewing the subsequent Archaeological Inventory Survey and Reconnaissance Level Survey for architectural resources within the APE during future consultation.

As this is early coordination, and not enough information on the proposed undertaking is available at this time, it is premature for the SHPO to provide complete and meaningful comment as to the eligibility and effects the proposed project may have on historic properties within the APE, as outlined in HRS Chapter 6E-8 and Section 106 of the National Historic Preservation Act. As plans are developed, a HRS Chapter 6E-8 and Section 106 request for concurrence must be submitted to the SHPO to formalize consultation. The Section 106 regulations specify what is required for a Section 106 review [36 CFR § 800.11]. **Please reference our LOG number and DOC number in all communication with this office regarding this undertaking.**

DHS is the office of record for this undertaking. Please maintain a copy of this letter with your environmental review record. If you have any questions about this undertaking or if there is a change to the scope of work, please contact Jessica Puff, Architectural Historian, at (808) 692-8023 or by email at jessica.l.puff@hawaii.gov.

Sincerely,

Dr. Alan S. Downer
Deputy State Historic Preservation Officer
Administrator, State Historic Preservation Division

MEETING MINUTES
FINAL (REVISED)
By: Alison Chiu
Date: 2/13/2017

Project:	Mayor Wright Housing Redevelopment Project
Meeting Date:	January 25, 2017
Time:	3:00 pm
Location:	FAI Conference Room
Attendees:	See attached sign-in sheet

I. Eligibility
   a. A report on public housing prepared by Mason Architects for Helber Hastert & Fee (April 2006) identified Mayor Wright Housing (MWH) site not eligible for listing to state/federal registers due to lack of integrity.
   b. However, a letter from SHPD indicated they consider MWH site eligible for listing under Criterion A for its association with the history of public housing
      i. Alison's comment: Letter (attached to these minutes) dated 3/6/2014, L2014.00533, D1402GC13, identified MWH as a significant historic site; clarification – eligibility for listing under Criterion A was identified in an email between SHPD and FAI 5/27/2016.

II. Project Team
   a. Property ownership – HPHA
   b. Master Developer – Hunt, with the possibility of long term lease and management.
   c. PBR Hawaii, Inc. – Planning consultants
   d. Fung Associates, Inc. – Historic consultants
   e. TCP Hawaii, LLC – Archaeology consultants
   f. SHPD – State agency and consulting party
   g. Historic Hawaii Foundation – Consulting party and community stakeholder
   h. Citizens Advisory Committee

III. Project Funding
   a. Project funding to include Part 58 low-interest funds for low-income public housing; no federal funds are currently being used in the planning phase.

IV. Project Overview / Current Status
   a. Project requirements
      i. 1-1 Replacement of 364 existing units,
      ii. Mixed-use, mixed-income,
      iii. Planning for 2,500 units
         1. Approximately 70% affordable

1833 Kalakaua Avenue, Suite 1008 ■ Honolulu, Hawaii 96815 USA ■ Tel: (808) 941-3000 ■ Fax: (808) 941-0900 ■ Email: projects@funghawaii.com

2. 30% work force
3. 40K-80K SF Mixed-use/Commercial; includes Community + Social Services space

iv. Projected to be all rentals at project completion.
v. Approximately 15 acre site

b. Project EIS
   i. EISPN prepared by PBR Hawaii, September 2016 is available publicly.
c. Master Plan
   i. Master Plan in progress. A new site plan was shared with meeting attendees, showing the general framework of proposed development, which will be located next to a planned transit station.
   ii. Anticipated 5 phase project with approximately 2500 units to be developed over ~10 years; there are currently 364 existing units. Anticipated street frontage low-rise to be in keeping with neighborhood feel, with 4 towers on site up to 400' high – massing and exact configuration TBD.
      1. HHF and SHPD expressed concern about the magnitude of increased density, and note that the visual effect may result in a larger area of potential effect (APE) beyond the project site itself.
      2. Property setbacks and proposed green space were discussed.
         a. SHPD suggests existing setbacks at neighborhood historic properties should be considered so the new design will be compatible with existing fabric, or will transition appropriately. How will people experience the perimeter visually or while moving through these spaces? Consider how these transitions will occur also in relation to nearby existing buildings, such as the United Methodist Church immediately adjacent.
         b. HHF noted the row of monkey pod trees located on the Kukui Gardens street frontage are a character-defining feature of the neighborhood, and suggested these be mirrored on the proposed development / existing MWH side.
      3. New designs should be compatible and creative – this can occur in a variety of ways, such as through window patterns, volumes, and massing that are in keeping with the scale and patterns seen throughout the neighborhood, without creating a false historicity to the new design.
      4. Avoid creating "slums of the future."
   iii. Commercial space: 40,000 to 80,000 SF with possible grocery store as an anchor.
      1. Commercial space also to include service-related providers, such as social and health services, and flexible space for community programs.
   iv. Note: Bill 28 exempts higher towers in transit oriented development areas; TOD plan for this area still requires approval.
   v. Currently, the team is focused on community outreach phase.

V. State Level: HRS Chapter 6E
   a. Review Process
      i. SHPD will complete 6E reviews with each submittal.
      ii. Related: Consider additional triggers, such as EPA, traffic patterns, etc.
   b. Identification of Historic Properties

FUNG ASSOCIATES INC.
architecture ■ preservation ■ planning ■ interiors

   i. HHF suggested a beneficial next step is to identify additional historic properties in the area that may be affected and to identify the potential effects.
   c. Potential Mitigation
      i. HHF recommended any agreed upon mitigation should be appropriate to the history of public housing.
      ii. Mitigation options include, but are not limited to:
         1. Oral histories to tell individual stories,
         2. Off-site mitigation – perhaps working with Palama Settlement, and
         3. Creative interpretations showing a historic perspective.

VI. Federal Level: Section 106
   a. EIS Report / NEPA
      i. Projected Report Completion: end of 2017
      ii. Projected Phase 1 Start: late 2018?
      iii. Section 106 language addressing future federal funding should be integrated into EIS report so the PA/MOA can be developed in parallel. Public comments regarding the EIS can and should then be included as pre-consultation for Section 106.
      iv. Even though this master plan portion is not HUD funded, team will be able to move forward on Section 106 with HPHA as the designated consultation authority.
      v. A "human capital" study has been done and should be added to the EIS report. This can help with future site and historic programming, which can be studied even beyond construction of MWH to its associations with Hawaiian royalty; however, it is necessary to not lose sight of the current people living there; their stories are rarely told and are important as well.
      vi. HHF recommended an ACHP resource document integrating NEPA and Section 106, which can be found at the following link: http://www.achp.gov/docs/NEPA_NHPA_Section_106_Handbook_Mar2013.pdf.
   b. PA/MOA will require a more complete master plan.
   c. Signatories for the PA/MOA should include:
      i. HUD, if they decide to participate,
      ii. HPHA,
      iii. Hunt (invited), and
      iv. Additional agencies as identified during this process.
   d. Stipulations:
      i. Since pre-consultation is being completed through Hunt, a stipulation of the PA/MOA should include appropriate transfer-with-obligations language to ensure the obligations agreed upon at this time will be carried out in the future.
      ii. Since elements of federal involvement are yet to be determined, a stipulation should address involvement of new agencies when identified.

VII. Next Steps:
   a. Agency involvement in pre-consultation process (HPHA).
   b. Confirm HUD involvement (PBR?).
   c. Provide letter to SHPD initiating 6E consultation, indicating existing APE; note that APE may change once indirect effects upon historic properties are fully considered (HPHA, PBR, and FAI).

LOG NO: 2014.00533
DOC NO: 1402GC13
Archaeology, Architecture

Dear Mr. Tsuji:

SUBJECT: **Chapter 6E-42 Historic Preservation Review –**
Pre-Consultation for an Environmental Assessment
Kalihi-Palama Health Center
Honolulu Ahupua'a, (Kona) District, Island of O'ahu
TMK: (1) 1-7-031:052

Thank you for initiating early consultation for developing an Environmental Assessment (EA) for the proposed new Kalihi-Palama Health Center within the Honolulu Judicial District. We received this request on February 12, 2014. The applicant, Kalihi-Palama Health Center, proposes to redevelop the project site which measures approximately 12,409 square feet in area. The proposed redevelopment includes construction of a new building atop the existing parking lot and renovating the existing commercial building in a subsequent phase. The submittal letter indicates the ED will focus on the second phase of the project which involves construction atop the existing parking lot.

Our records indicate the Kalihi-Palama Health Center site is surrounded by a significant amount of architectural historic properties including Mayor Wright Housing, Kaumakapili Church and, the New Palama (later Zamboanga) Theater. However, the construction of the new health center will not harm the integrity of these historic buildings. Our records also indicate that no archaeological inventory survey has been conducted, and that no archaeological historic properties have been identified within the subject property. However archaeological studies in the area have documented human burials within 500-600 m of the subject property. Dunn et al (1991) identified two burials (SIHP 50-80-14-3373) about 80 cm (30 inches) below the surface during archaeological monitoring at the corner of N. King and Robello Lane. It is believed these two burials may be related to the Keone'ula area cemetery for smallpox victims. Hammatt (1995) identified an in situ burial pit (SIHP 50-80-14-4929) during a Board of Water Supply project within Austin Lane. In addition, research indicates a former cemetery associated with Kaumakapili Church existed on TMK: (1) 1-5-005:015 and 038.

Based on the above, we have insufficient information for making a determination that no archaeological historic properties will be affected by the proposed project, which may involve subsurface excavation for utilities. **We request more information** on the scope of all project activities in order to assess potential effects on historic properties.

Please contact Anna Broverman at (808) 692-8023 or at Anna.E.Broverman@hawaii.gov for any questions regarding architectural resources. Please contact me at (808) 692-8019 or at Susan.A.Lebo@hawaii.gov if you have any questions regarding archaeological resources or this letter.

Aloha,

Susan A. Lebo

Community-Based Vision

Mayor Wright Homes and the surrounding Kalihi neighborhood are poised for a comprehensive approach to transformation, where HPHA and Hunt Development, local leaders, residents, schools, police, firefighters, business owners and nonprofits can all join together to create and implement a community-centered plan that can simultaneously address all of the site's robust challenges and opportunities.

A strong alignment of all community resources can build critical human capital, improve social, organizational, educational, cultural and economic benefits, and generally improve the quality of life for all community stakeholders. And although each of these resources is most often viewed as a separate and distinct asset, it is often the interactions between all of them that can most effectively and efficiently improve the health and well-being for both individuals and the whole community system.

By far, the most important assets and resources at Mayor Wright Homes are the people who live there. In initial conversations with local residents we found an encouraging combination of strong will and personal passion among the residents who participated. Expanding the resident participation and aligning their passions with productive outcomes present some important opportunities to reinforce and greatly expand on an historical "aloha" spirit.

Our Community-Based Vision for Mayor Wright Homes was a collaborative effort with various forums for community involvement, from interim community meetings and the establishment of a Community Advisory Committee (CAC) to a weeklong *charrette* held onsite. The input and insights gained through this community-centric process informed the draft Master Plan.

We have held several resident and community meetings, attended and reported at area neighborhood board meetings, and held a week-long conceptual design *charrette* onsite at MWH. In addition, the project team has reached out to area legislators and councilmembers, businesses, schools, churches, and service providers and encouraged them to participate throughout the planning process.

The groups listed many suggestions especially for improving security within MWH and throughout the neighborhood. These ranged from tangible, physical improvements like better lighting and security cameras to social events and programming that encourages community building, with one group noting that "knowing your neighbors makes it a safer place." Several groups made notes that currently "nothing" contributes to safety at MWH and that the "minimal" security presence is "ineffective."

The Project Team Meets with Residents Off-Site

The project team held meetings on and off-site to encourage participation; the meeting above was held at Palama Settlement.

The Project Team Meets with Residents Onsite

The project team held a workshop for Mayor Wright Homes residents onsite.

To this end we have attempted to identify some initial projects and programs that could promote early wins between the Hunt design/development/construction team, HPHA and the current resident population. The most pressing of these is a plan for temporary relocation of residents during the construction phase of the work.

Community and Resident Meetings

As part of the community-outreach effort, meetings with the Mayor Wright Homes residents and community members were held at different points in the process to keep the residents informed and solicit feedback on the progress being made. These community engagement events were held on May 5th and 24th, 2016; June 28th, 2016; and July 20th and 28th, 2016 on and off-site.

Activities at the community meetings ranged from presentations and discussions, identifying areas for focus and group map exercises, to children's drawings and notecards for feedback. The results of these activities were compiled after each meeting and presented back to the groups in order to confirm the information was heard correctly. Then, this information was used to develop the program and goals of the project.

Community Advisory Committee

The Community Advisory Committee (CAC) is a voluntary advisory group that assists in the promotion and dissemination of public information, provides feedback to the planning team, and helps guide the process. The CAC were sought out to addressed the varying needs, aspirations, and concerns of the area's diverse constituencies; residents, business owners, and local organizations and officials to build community support. Members of the 20+ person CAC include residents, business owners, DOE school principals, faith-based organizations, and social service providers.

The members of the CAC help spread the word about upcoming meetings and assure that we are reaching all segments of the community. Their main focus has been to provide input from the perspective of the community they represent, not just their personal interests.

5-Day Public Charrette at Mayor Wright Homes

On-Site Public Charrette
Meetings and preliminary design took place in a tent at the center of the Mayor Wright Homes site.

Stakeholder Meetings
The design team met with public and private stakeholders to better understand site opportunities.

Listening and Learning
Residents and the community provided valuable insight for the transformation of the site.

Interim Presentation
The team presented to the community three times: at the opening, mid-week and closing of the charrette.

Design Work On-Site
The design team's charrette work area was open to the public.

Discussing Concepts
During pin-ups attendees could review, ask questions, and comment on the conceptual designs.

Social Gathering Place
The charrette tent quickly became a meeting place for conversations among residents and visitors.

One-on-One Conversations
The team was available for one-on-one conversations with anyone who attended the charrette.

Young Residents
The youngest residents could always be found in and around the charrette tent.

***Charrette* and Stakeholder Meetings**
The goal of the five-day *charrette*, held from August 8-12, 2016 was to come up with a redevelopment plan for Mayor Wright Homes, and to engage the residents and community at-large in the design process. Informal drop-ins from current residents allowed the design team to hear many of the residents' concerns ranging from safety to displacement and enabled the team to address those issues directly.

Ongoing presentations and group activities throughout the week provided invaluable interaction between the design team and the participants which is ultimately reflected in the draft Master Plan.

Concurrently, community stakeholders met with the development team in roundtable discussions to learn and speak about their respective interests for the greater success of the community. From policemen, firemen, school administrators and social service providers to cultural affair agencies, city planning officials, regulatory bodies and elected officials, these stakeholder meetings enhanced the plan's viability and scope to incorporate broader community goals.

Charrette Schedule
The charrette took place over five days from as early as 6 am to as late as 8 pm.

Conceptual Site Plan Drawings

The design team tested numerous arrangements of streets, development blocks, and open spaces during the charrette. All of them have in common that they bring new streets into the site and create smaller development blocks.

Sketch Master Plan

This sketch master plan was developed during the 5-day charrette. It shows the site layout and connections to the rail station and other destinations in the neighborhood.

MAYOR WRIGHT HOUSING – LIST OF MEETINGS

NEIGHBORHOOD BOARD MEETINGS

- May 9, 2016 - Liliha/Puʻunui/ʻĀlewa/Kamehameha Heights Neighborhood Board #14 Meeting – Maʻemaʻe Elementary School Cafeteria, 7:00 p.m.
- May 18, 2016 - Kalihi-Pālama Neighborhood Board #15 Meeting – Kalihi Union Church, 7:00 p.m.
- June 13, 2016 - Liliha/Puʻunui/ʻĀlewa/Kamehameha Heights Neighborhood Board #14 Meeting– Maʻemaʻe Elementary School Cafeteria, 7:00 p.m.
- July 11, 2016 - Liliha/Puunui/ʻĀlewa/Kam Heights Neighborhood Board #14 Meeting - Maʻemaʻe Elementary School Cafeteria, 7:00 p.m.
- October 19, 2016 – Kalihi-Pālama Neighborhood Board #15 Meeting – Kalihi Union Church, 7:00 pm

Au Puni O Hawaii

Established: 1992

Summary: As GUARDIANS of "The Hawaiian Homes Commission Act of 1920," our organization seeks to educate and raise our opios and makuas in the ways of cultural intelligence and historical "Hawaiian home lands" protocol. As beneficiaries, we would like to share our mana'o on preservation, restoration, INTERPRETATION, and shared dialogues with respect to our cultural land-based assets. Our mission is to perpetuate compact advocacy for our communities at large, and coordinate projects like providing aid and relief to the general public in regards to provisions, securities for all family units, and most of all the well-being of our na kupuna. We will work relentlessly for the betterment of the native Hawaiians as defined in the HHCA with our local County and State agencies, and the Federal Government with our primary goal to live "SPIRITUALLY FREE and ALOHA."

Hui Kaleleiki Ohana
Kaleleiki Family Organization

Established: 2005

Summary: Our mission is the restoration and preservation of our ohana kuleana lands and our iwi kupuna in perpetuity. Our history is that we are lineal descendants of a kuleana awardee of the Great Mahele, whose lineage was authenticated in 2007. Our vision is to educate, assist, and advocate for the Native Hawaiian community, especially lineal descendants of awardees of a Palapala Sila Nui, issued by the Board of Commissioners to Quiet Land Titles beginning in 1845, on matters relevant to today.

Kaha I Ka Panoa Kaleponi Hawaiian Civic Club
The Breath of Life in the California Desert

Established: Apr 2010

Summary: Living on the continent gives us very little access to issues at home. However, our concerns lean to those museums, libraries, etc. that continue to house artifacts that need to be returned to our kulaiwi (native land), We continually work to preserve the cultural traditions of our kupuna (elders) ub iur language, music, and moʻokuʻauhau genealogy.

Kauwahi ‘Anaina Hawai‘i Hawaiian Civic Club

Established: Oct 2005

Summary: As an organization under the auspices of our parent the Association of Hawaiian Civic Clubs, Kauwahi ‘Anaina Hawai‘i Hawaiian Civic Club's purpose is to promote and perpetuate traditional Native Hawaiian values and cultural expressions, especially as our children born outside of our native Hawai‘i may learn and embrace those same values and practices. Also, it is of prime importance that other Native Hawaiians in Utah have a sense of identity with other Native Hawaiians in this locale through Kauwahi ‘Anaina Hawai‘i Hawaiian Civic Club, while being effective contributors in our individual communities and strong supporters of issues concerning Native Hawaiians in the State of Hawai‘i.

Lahui Kakaʻikahi

Endangered Species

Established: May 2009

Summary: This organization is exclusively for charitable and educational purposes. It is our mission to provide Native Hawawiians with hand-on training in the construction industry. We will accomplish this mission by fostering the sense of "doing" and innovative thinking that is an intrinsic part of our culture. We envision a Native Hawaiian workforce that is both leading-edge and culturally cognizant at the same time. We will encourage our students to cultivate the value of Malama by passing on their knowledge to others in their community and by providing additional career opportunities for other Native Hawaiians, should they choose to go into business for themselves.

Native Hawaiian Church

Established: 2009

Summary: Protect, promote, and preserve native Hawaiian religious, cultural, and spiritual practices and traditions related to the people of old. These traditions and practices have evolved and continue to develop to enrich and nurture the wellness and health of the people and the land. These practices and traditions include Makahiki, Hooponopono, Hookuikahi, Laau Lapaau, and Lomilomi as passed down and practiced in today's world. These practices and traditions require a commitment to protect and preserve all archeological, historical, and iwi kupuna burial sites as sacred sites deserving respect and preservation. The protection and preservation of these sacred sites includes traditional cultural properties, places, and natural resources, and foods, plants, fishes, birds, and animals.

Updated: April 5, 2018

SUPPLEMENTARY INFORMATION: Section 7209 of IRTPA, as amended, provides that upon full implementation, U.S., Bermudian, and Canadian citizens, and Mexican nationals would be required to present a passport or such alternative documents as the Secretary of Homeland Security designates as satisfactorily establishing identity and citizenship upon entering the United States.

In a Notice of Proposed Rulemaking (NPRM) published in the **Federal Register** on June 26, 2007 (72 FR 35088), DHS and the Department of State (DOS) described the second phase of a joint plan, known as WHTI, to implement these new requirements. The NPRM proposed the specific documents that U.S. citizens and nonimmigrant aliens from Canada, Bermuda, and Mexico would be required to present when entering the U.S. at sea and land ports-of-entry from Western Hemisphere countries.

DHS and CBP have analyzed the potential impacts on the human environment of several alternate ways of implementing WHTI at sea and land ports-of-entry based on technological and operational considerations as part of the decision-making process. The impact analysis in the Final PEA and FONSI focuses primarily on the effects of implementing WHTI at land ports-of-entry because the land environment is the most sensitive to the proposed document and technological changes associated with implementation of WHTI.

Four technological and operational alternatives to meet the requirements to define and process secure, standardized travel documents under WHTI are analyzed in the PEA. The four alternatives are: (1) No-Action Alternative: maintain the status quo; (2) Standardized Documents Alternative: accept a limited number of document categories for admission at all sea or land ports-of-entry (LPOEs); (3) MRZ Alternative: Accept standardized documents that contain a Machine Readable Zone (MRZ); and (4) RFID Alternative: Accept standardized documents that contain Radio Frequency Identification (RFID) technology and an MRZ, for the use of RFID-enabled readers at the busiest LPOEs and MRZ at all LPOEs. As described in the PEA, air quality and noise are the primary resource areas that have the most potential to be affected by implementation of WHTI. However, no significant environmental impacts to these resources or any other human or natural environments from the implementation of any of the WHTI alternatives are anticipated.

Dated: September 19, 2007.

Eugene H. Schied,

Assistant Commissioner, Office of Finance.

[FR Doc. E7–19035 Filed 9–25–07; 8:45 am]

BILLING CODE 9111–14–P

DEPARTMENT OF THE INTERIOR

Office of the Secretary

Native Hawaiian Organization Notification List

AGENCY: Office of Hawaiian Relations, Office of the Secretary, Department of the Interior.

ACTION: Creation of a Native Hawaiian Organization Notification List to be maintained by the U.S. Department of the Interior, Office of Hawaiian Relations.

SUMMARY: The Office of Hawaiian Relations (OHR), within the Office of the Secretary, U.S. Department of the Interior (DOI), has developed criteria for establishment of a Native Hawaiian Organization Notification List (Notification List). The purpose of the Notification List is to provide the DOI officials with a tool to help satisfy their statutory notification obligations under such laws as the National Environmental Policy Act (NEPA), the National Historic Preservation Act (NHPA), and the Native American Graves Protection and Repatriation Act (NAGPRA). It is also the intent of the Office of Hawaiian Relations to make available to other Federal agency officials this mechanism to assist them with their reasonable and good faith efforts to identify Native Hawaiian organizations that are to be notified or consulted with when required by statute or when desired.

DATES: Eligible organizations should submit their application for inclusion on the list. Although organizations may apply for inclusion on the list at anytime, we will begin using the list on November 26, 2007.

ADDRESSES: To apply for placement of an organization on the Notification List send certification to: Ka'i'ini K. Kaloi, Director, Office of Hawaiian Relations, 1849 C Street, NW., MS 3543, Washington, DC 20240.

SUPPLEMENTARY INFORMATION:

1. What Does the Native Hawaiian Organization Notification List Do?

a. The Native Hawaiian Organization Notification List, to be maintained and housed within OHR, is designed to assist the DOI and other agencies to locate and communicate with interested Native Hawaiian organizations when statutory, regulatory, or when otherwise desired by the agency.

b. The Native Hawaiian Organization Notification List may assist other Federal agency officials with their reasonable and good faith efforts to identify Native Hawaiian organizations that are to be notified or consulted with when required by statute or when otherwise desired by the agency.

c. The Native Hawaiian Organization Notification List is voluntary, and Native Hawaiian organizations are not required to participate in the Notification List. However, it is anticipated that Federal agencies will rely on this list.

d. The placement of an organization on the Notification List shall not be construed as recognition by the Federal Government that the organization is a governmental, tribal, or other similar type entity.

e. The placement of an organization on the Notification List is not intended to and does not confer any substantive or procedural right, benefit, or privilege enforceable at law or in equity, which is not otherwise available to the organization by law, by any party against the United States, its agencies or instrumentalities, its officers or employees, or any other person.

f. The Notification List is created as a convenience for the U.S. Government and Native Hawaiian organizations. It does not provide a basis for legal action against the U.S. Government.

2. How Does a Native Hawaiian Organization Apply To Be on the Native Hawaiian Organization Notification List?

a. An organization must certify in writing to OHR the following:

i. The organization serves and represents the interests of Native Hawaiians;

ii. The organization has as a primary and stated purpose the provision of services to Native Hawaiians;

iii. The organization has expertise in Native Hawaiian affairs; and

iv. The organization would like to be placed on the Notification List.

b. The certification must be signed and dated by the organization's governing body and include a valid U.S. mailing address where the organization wants notifications to be sent.

c. The request may also include the organization's topical and geographic areas of interest.

d. If the certification from the organization is incomplete, the organization may not be listed.

e. It is a violation of Federal law to make false, fictitious, or fraudulent statements to the Federal Government.

3. How Long Does Registration on the Notification List Last?

Placement on the list is valid for five years. Placement automatically expires at the end of five years, measured from the date the organization was placed on the Notification List or last had its membership renewed, whichever is more recent. The OHR will notify the organization at the last listed address of the need to renew their membership on the Notification List.

4. How Will DOI Manage and Provide Public Notification of the List?

a. The DOI will maintain the Native Hawaiian Organization Notification List and will periodically update it.

i. The OHR will publish on the DOI Web site the names and contact information of the listed Native Hawaiian organizations. The information contained therein will be updated periodically

ii. Copies of the Notification List and instructions outlining how to become a listed organization will also be available online or may be requested from the OHR.

5. How Will Listed Native Hawaiian Organizations Be Notified of Federal Actions?

a. Agency officials who are seeking to consult with Native Hawaiian organizations regarding a NAGPRA or NHPA action should notify those Native Hawaiian organizations on the Notification List.

b. The notification should:

i. Be sent to the address listed on the Native Hawaiian Organization Notification List;

ii. Outline the Federal action to take place that will affect Native Hawaiians;

iii. Provide a point of contact within the acting agency for the Native Hawaiian organization where inquiries may be sent.

6. What Must a Listed Native Hawaiian Organization Do in Order To Remain on the Notification List?

a. To remain on the Notification List, Native Hawaiian organizations must submit a written request at least every five years. It is the responsibility of the organization to notify the OHR of changes to its U.S. mailing address.

b. The request to remain on the Notification List must be sent to the DOI, OHR, within 30 days before the organization's listing expires.

c. The request to remain on the Notification List must include a certification, signed and dated by the organization's governing body, that includes:

i. The organization's current contact information, including a valid U.S. mailing address;

ii. A statement that the organization meets the criteria listed in 2(a)(i)–(iii); and

iii. A statement that it is the official position of the organization to remain on the Notification List.

d. If the information submitted by an organization to update its registration is incomplete, the organization may not remain listed.

e. If an organization does not provide a satisfactory update every five years, registration on the Notification List will automatically expire. Registration automatically expires at the end of two years measured from the date the organization was placed on the Notification List or the date the organization last submitted a written request to remain on the Notification List, whichever is more recent.

7. How Does an Organization Voluntarily Remove Its Name From the Notification List?

a. If an organization wants to be removed from the Notification List prior to the automatic expiration date, the organization must send a signed and dated written statement from the organization's governing body affirmatively requesting removal from the Notification List.

b. After receipt of the removal request, the OHR will remove the organization during the periodic update of the Notification List.

Dated: September 5, 2007.

Ka'i'ini Kaloi,

Director, Office of Hawaiian Relations.

BILLING CODE 4310–02–P

DEPARTMENT OF THE INTERIOR

Fish and Wildlife Service

Lacassine National Wildlife Refuge

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Notice of availability of the Final Comprehensive Conservation Plan (CCP) and Finding of No Significant Impact (FONSI).

SUMMARY: We, the Fish and Wildlife Service, announce our decision and the availability of the Final CCP and FONSI for Lacassine National Wildlife Refuge in Cameron and Evangeline Parishes, Louisiana. The CCP was prepared pursuant to the National Wildlife Refuge System Improvement Act of 1997, and in accordance with the National Environmental Policy Act of 1969, and describes how the refuge will be managed for the next 15 years.

ADDRESSES: A copy of the CCP/FONSI may be obtained by writing to: Lacassine National Wildlife Refuge, 1428 Highway 27, Bell City, Louisiana 70630; Telephone: 337/598–2216. The CCP/FONSI may also be accessed and downloaded from the Service's Web site: *http://southeast.fws.gov/planning/.*

FOR FURTHER INFORMATION CONTACT: Judy McClendon, Refuge Planner, at the address in the **ADDRESSES** section or by electronic mail at the following address: *judy_mcclendon@fws.gov.*

SUPPLEMENTARY INFORMATION:

Introduction: With this notice, we finalize the CCP process for Lacassine National Wildlife Refuge, begun as announced in the **Federal Register** (68 FR 2566; January 17, 2003). For more about the process, see that notice. We released the Draft CCP and Environmental Assessment (EA) to the public, announcing and requesting comments in a notice of availability in the **Federal Register** (71 FR 65832; November 9, 2006). Lacassine National Wildlife Refuge, established on December 30, 1937, is one of four refuges that makes up the Southwest Louisiana National Wildlife Refuge Complex. The 34,724-acre refuge is strategically located on the boundary of coastal marshes and agricultural habitats at the southern terminus of the Mississippi and Central Flyways, making the refuge critically important to migratory birds, especially wintering waterfowl.

With this notice, we announce our decision and the availability of the Final CCP/FONSI in accordance with the National Environmental Policy Act [40 CFR 1506.6(b)] requirements. We completed a thorough analysis of the environmental, social, and economic considerations, which we included in the Final CCP/FONSI. The FONSI documents the selection of Alternative B, the preferred alternative.

Alternatives and Preferred Alternative: The Draft CCP/EA identified and evaluated three alternatives for managing the refuge over the next 15 years. Alternative A, the no-action alternative, would have continued current management of the refuge. Alternative C would refocus management priority to actively investigating and extending the life/value of Lacassine Pool as a migratory bird sanctuary. We chose Alternative B (maximize refuge management capabilities in all programs) as our preferred alternative. This determination was made based on the

EXHIBIT 13

Preserving America's Heritage

October 25, 2018

Mr. Hakim Ouansafi
Executive Director
Hawaii Public Housing Authority
1002 North School Street
Honolulu, HI 96817

Ref: *Proposed Demolition and Redevelopment of the Mayor Wright Homes located on North Kukui Street Island of O'ahu, Hawaii*
ACHPConnect Log Number: 13262

Dear Mr. Ouansafi:

The Advisory Council on Historic Preservation (ACHP) has received your notification and supporting documentation regarding the adverse effects of the referenced undertaking on a property or properties listed or eligible for listing in the National Register of Historic Places. Based upon the information provided, we have concluded that Appendix A, *Criteria for Council Involvement in Reviewing Individual Section 106 Cases*, of our regulations, "Protection of Historic Properties" (36 CFR Part 800), does not apply to this undertaking. Accordingly, we do not believe that our participation in the consultation to resolve adverse effects is needed. However, if we receive a request for participation from the State Historic Preservation Officer (SHPO), Tribal Historic Preservation Officer (THPO), affected Indian tribe, a consulting party, or other party, we may reconsider this decision. Additionally, should circumstances change, and it is determined that our participation is needed to conclude the consultation process, please notify us.

Pursuant to 36 CFR §800.6(b)(1)(iv), you will need to file the final Memorandum of Agreement (MOA), developed in consultation with the Hawaii State Historic Preservation Officer (SHPO), and any other consulting parties, and related documentation with the ACHP at the conclusion of the consultation process. The filing of the MOA, and supporting documentation with the ACHP is required in order to complete the requirements of Section 106 of the National Historic Preservation Act.

Thank you for providing us with the notification of adverse effect. If you have any questions or require further assistance, please contact Anthony G. Lopez at (202) 517-0220 or by email at alopez@achp.gov.

Sincerely,

LaShavio Johnson

IN REPLY PLEASE REFER TO:
19:OED/66

October 29, 2019

MEMORANDUM:

TO: The Honorable David Y. Ige
Governor, State of Hawaii

THROUGH: Pankaj Bhanot, Director
Department of Human Services Pankaj Bhanot.

FROM: Hakim Ouansafi, Executive Director
Hawaii Public Housing Authority

SUBJECT: Recommendation to the Governor as Agency Official Under Section 106 National Historic Preservation Act to Execute the Memorandum of Agreement Between the State of Hawaii, the Hawaii Public Housing Authority, the State Historic Preservation Officer, and MWH Partners, LLC Regarding the Demolition and Redevelopment of the Mayor Wright Homes Public Housing Development

REFERENCES:
HPHA 18:OED/32 Memorandum dated June 25, 2018
HPHA 18:OED/68 Memorandum dated October 26, 2018

Requested Action:

The Hawaii Public Housing Authority ("HPHA") respectfully recommends the Governor of the State of Hawaii, as the Agency Official under Section 106 of the Historic Preservation Act, take the following action:

Execute the Memorandum of Agreement Between the State of Hawaii, the Hawaii Public Housing Authority, the State Historic Preservation Officer, and MWH Partners, LLC Regarding the Demolition and Redevelopment of the Mayor Wright Homes Public Housing Development. See Tab 1.

Background and Purpose of the Request

In the Memorandum dated June 25, 2018 (18:OED/32) (attached under Tab 2), the HPHA stated that it is evaluating the potential redevelopment of the Mayor Wright Homes public housing development located at 521 North Kukui Street, Oahu, Honolulu Tax Map Key ("TMK") No. (1) 1-7-029:003 ("Site"). The overall redevelopment program would include applying to the U.S. Department of Housing and Urban Development ("HUD") to raze the existing structures and redevelop the site as a mixed-finance, mixed-use housing development (the "Project"). The proposed Project will total approximately 2,448 residential rental units; approximately two-thirds of which shall be affordable units, including the replacement of the existing 364 public housing units on site, on a one-for-one basis, with similarly deeply subsidized units. In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

As the HPHA plans to leverage federal funding for the proposed Project, the Project is required to comply with Section 106 of the National Historic Preservation Act of 1966 and Section 106, as amended ("NHPA"). The HPHA's June 25 memorandum requested the Agency Official to (i) declare the MWH project an "*Undertaking*" pursuant to 36 C.F.R. § 800.2 and (ii) authorize the HPHA, its development partner and their consultants to initiate and conduct consultation with the State Historic Preservation Officer ("SHPO") and other consulting parties as allowed under 36 C.F.R. § 800.2(a)(3). Additionally, because the Project will involve the demolition of the existing buildings on the Project site, which have been identified as eligible for listing on a historic register, the HPHA informed the Agency Official that the redevelopment will ultimately result in a determination of "adverse effect" with regard to historic architectural resources.

In the Memorandum dated October 26, 2018 (18:OED/68) (attached under Tab 3), the HPHA, based on its continued consultation with the SHPO and Historic Hawaii Foundation, recommended the Agency Official identify and apply a finding of "*Adverse Effect*" for the Mayor Wright Homes Redevelopment Project pursuant to 36 C.F.R. § 800.5(a)(1). This allowed the HPHA to continue the consultation process, determine mitigation to address and resolve the adverse effect, and memorialize the proposed mitigation in the form of a Memorandum of Agreement ("MOA") pursuant to 36 C.F.R. § 800.6 that the HPHA could recommend to the Agency Official for acceptance and execution.

After continued consultation with the SHPO and Historic Hawaii Foundation to consider mitigation measures to address the adverse effect determination, all parties agreed to appropriate mitigation measures which are set forth in the attached MOA. The HPHA is now presenting its recommendation to the Agency Official to accept and execute the attached MOA.

Once accepted and executed by the Agency Official, the executed MOA will be included in the Environmental Assessment for the Project being prepared pursuant to the National Environmental Protection Act to evidence Section 106 compliance. The HPHA,

on behalf of the Agency Official, will also file the final executed MOA and related supporting documentation with the Advisory Council on Historic Preservation ("ACHP") upon conclusion of the consultation process, pursuant to 36 C.F.R. § 800.6(b)(1)(iv), which will complete the NHPA compliance requirements required for the undertaking.

HPHA shall also provide a copy of this authorization to the SHPO.

Accordingly, the HPHA recommends the Governor, as the Section 106 Agency Official, execute the Memorandum of Agreement Between the State of Hawaii, the Hawaii Public Housing Authority, the State Historic Preservation Officer, and MWH Partners, LLC Regarding the Demolition and Redevelopment of the Mayor Wright Homes Public Housing Development under Tab 1.

As time is of the essence, the HPHA is transmitting this MOA with the scanned signature page (not an original) of the State Historic Preservation Officer, Dr. Alan Downer. MWH Partners, LLC (Hunt Development) has been unable to secure Dr. Downer's original signature page. Please note the HPHA will not distribute the MOA executed by the Governor to the other parties or the ACPH until the HPHA receives the original signature page from Dr. Downer.

When executing this agreement, please insert the date of your signature on page 1 of 19 of the MOA. This date will be the effective date of the MOA.

If you have any questions or concerns regarding this matter, please contact Hakim Ouansafi, Executive Director at (808) 832-4682.

MEMORANDUM OF AGREEMENT
BETWEEN
THE STATE OF HAWAII,
THE HAWAII PUBLIC HOUSING AUTHORITY,
THE STATE HISTORIC PRESERVATION OFFICER,
AND MWH PARTNERS, LLC
REGARDING THE DEMOLITION AND REDEVELOPMENT OF
THE MAYOR WRIGHT HOMES PUBLIC HOUSING DEVELOPMENT

THIS AGREEMENT ("Agreement") is made this 13th day of November, 2019 by and between the State of Hawaii as the Responsible Entity, by and through its Certifying Officer of the Responsible Entity, the Governor of the State of Hawaii ("Governor) as described below, the Hawaii Public Housing Authority, a public body corporate and politic ("HPHA"), the Hawaii State Historic Preservation Division, a division of the Department of Land and Natural Resources of the State of Hawaii ("SHPD") and MWH Partners, LLC, a Delaware limited liability company ("Developer") (collectively "Signatory Parties") for the purposes herein set forth.

RECITALS

WHEREAS, pursuant to 24 C.F.R. ("CFR") Part 58, the U.S. Department of Housing and Urban Development ("HUD") designated the State of Hawaii as the Responsible Entity, as defined in 24 CFR § 58.2(a)(7), for environmental reviews of HPHA public housing projects, and the Governor as the certifying officer of the Responsible Entity. Pursuant to 24 CFR §§ 58.4 and 58.5, the State of Hawaii, as the Responsible Entity, must assume responsibilities for environmental review, decision-making and action that would apply to HUD under the National Environmental Policy Act of 1969, as amended (42 U.S.C. § 4321 et seq.) ("NEPA"), Section 106 of the National Historic Preservation Act, as amended (54 U.S.C. § 306108, formerly 16 U.S.C. § 470f ("Section 106"), and Section 106 implementing regulations at 36 CFR Part 800. Accordingly, pursuant to 24 CFR §§ 58.5 and 58.13, as the Responsible Entity's Certifying Officer, the Governor is the "responsible Federal official" as that term is used in section 102 of NEPA, and the "Agency Official" as that term is used in Section 106 and 36 CFR Part 800. The Governor, as the Certifying Officer of the Responsible Entity and Section 106 Agency Official, hereby delegates authority to HPHA to implement and monitor this Agreement; and

WHEREAS, HPHA is the owner of a 364-unit public housing development located at 521 North Kukui Street in Honolulu, Hawaii, known as the Mayor Wright Homes, and more particularly located on the parcels described in the attached Exhibit A (the "Property"). The thirty-six buildings on the 14.8 acre Property were built in 1952 and have been determined to be functionally obsolete; and

WHEREAS, HPHA has determined that it can best meet the needs of existing tenants residing at the Property and provide additional housing to the surrounding community by entering into a public-private partnership with a private developer to redevelop the Property; and

WHEREAS, through a competitive bidding process, HPHA selected Developer to plan, pursue and

undertake redevelopment of the Property pursuant to the terms and conditions of that certain Master Development Agreement dated December 29, 2017 made by and between HPHA and Developer ("MDA"); and

WHEREAS, due to Developer's extensive involvement in project implementation, HPHA invited Developer to sign this Agreement as an Invited Signatory; and

WHEREAS, HPHA plans to apply to the HUD for permission to demolish the existing housing units located on the Property pursuant to Section 18 of the United States Housing Act of 1937, as amended ("Housing Act") (42 U.S.C. § 1437p). In addition, HPHA, together with Developer, intends to redevelop the Property into a mixed income development that will replace all of the demolished public housing with new public housing or other similarly deeply subsidized units, construct a significant number of affordable and market rate units, and build commercial/retail space. The demolition and redevelopment together shall be referred to herein as the "Project." The Project will be undertaken in multiple phases over an approximate 10-12 year overall development period and will utilize funds from HUD including but not limited to Project Based Vouchers authorized by Section 8 of the Housing Act (42 U.S.C. § 1437f), public housing capital or operating funds authorized by Section 9 of the Housing Act (42 U.S.C. § 1437g), and/or conversion assistance pursuant to the Rental Assistance Demonstration ("RAD") Program authorized by the Consolidated and Further Continuing Appropriations Act of 2012 and HUD Notice PIH-2012-32 (HA) REV-1 (July 2, 2013), as may be further amended. Due to the involvement of HUD and HUD funds for the Project, the Project is an undertaking subject to review under Section 106 and its implementing regulations, 36 CFR Part 800; and

WHEREAS, HPHA has defined the undertaking's architectural area of potential effect ("APE") as the area within the general boundaries of Austin Lane to the north, Lunalilo Freeway to the east, River Street to the south and Dillingham Boulevard and Iwilei Road to the west in Honolulu, Oahu (includes the project site and portions of Honolulu Tax Map Key (TMK) Nos. (1) 1-5-006; 1-5-007, 1-5-017, 1-6-001, 1-7-023, 1-7-026, 1-7-027, 1-7-029, 1-7-031, 1-7-032, 1-7-033, and 1-7-045 (see Exhibit B); and

WHEREAS, HPHA has defined the undertaking's archaeological APE as the 14.8 acre project footprint located at 521 North Kukui Street (Honolulu TMK No. (1) 1-7-029:003) (see Exhibit B); and

WHEREAS, the Governor, as the certifying official of the Responsible Entity and Agency Official under Section 106, has determined that the undertaking will have an adverse effect on the Property, which has been determined eligible for listing in the National Register of Historic Places, and through HPHA has consulted with SHPD under 36 CFR Part 800; and

WHEREAS, SHPD has reviewed and conditionally concurred with the evaluations and recommendations in the following referenced materials *Reconnaissance Level Survey for Mayor Wright Housing* and *Archaeological Inventory Survey of the Mayor Wright Homes Redevelopment Project Honolulu (Nu'uanu) Ahupua'a, Honolulu (Kona) District, O'ahu Island, Hawai'i TMK (1) 1-7-029:003* (May 2018); and

WHEREAS, in July 2018, HPHA and Developer prepared and delivered over 100 letters of invitation ("Invitation") and accompanying background materials describing the proposed undertaking to organizations and individuals with a potential interest in the proposed undertaking and its potential to affect historic properties including all Native Hawaiian Organizations identified on the *Native Hawaiian Organization Notification List* published by the U.S. Department of the Interior, and maintained by the Office of Native Hawaiian Relations, to identify any Native Hawaiian Organizations and/or Native Hawaiian descendants who may have ancestral lineal or cultural ties, knowledge, or religious attachment

or concerns regarding the proposed undertaking (See Exhibit C). Three parties responded to the Invitation and, of these, only the Historic Hawaii Foundation, a Hawaii nonprofit corporation ("Concurring Party") expressed a desire to participate in consultation as a consulting party; and

WHEREAS, HPHA and Developer have consulted with Concurring Party regarding the effects of the undertaking on historic properties and has invited them to sign this Agreement as a concurring party; and

WHEREAS, in accordance with 36 CFR § 800.6(a)(1), HPHA has notified the Advisory Council on Historic Preservation ("ACHP") of the Governor's adverse effect determination with specified documentation, and ACHP has chosen not to participate in the consultation pursuant to 36 CFR §800.6(a)(1)(iii) (see Exhibit D); and

NOW, THEREFORE, the State of Hawaii, by and through the Governor, in his capacity as Responsible Entity's Certifying Officer and the Section 106 Agency Official, HPHA, SHPD, and Developer agree that the undertaking shall be implemented in accordance with the following stipulations in order to take into account the effect of the undertaking on historic properties.

STIPULATIONS

I. DOCUMENTATION OF MAYOR WRIGHT HOMES COMPLEX

HPHA shall require Developer to consult with the National Park Service ("NPS") Historic American Buildings Survey ("HABS"), Historic American Engineering Record ("HAER") and Historic American Landscapes Survey ("HALS") (collectively "HHH") Coordinator in the Pacific West Regional Office as to the required type and level of HHH documentation and on the guidelines and protocols for HHH documentation submission.

HPHA shall require Developer to ensure that all HHH documentation activities will be performed or directly supervised by architects, historians, photographers and/or other professionals meeting the minimum qualifications in their field as specified in the Secretary of Interior's Professional Qualifications Standards ("Qualification Standards") as further defined in 36 CFR 61; Appendix A.

HPHA shall require Developer to provide to the NPS originals of all HHH documentation. The NPS-approved HHH documentation will then be digitally submitted to SHPD.

HPHA shall require Developer to receive NPS approval of the submitted HHH documentation ("NPS-Approved Documentation") prior to any demolition or construction activities.

HPHA shall require Developer to submit digital copies of NPS-approved Documentation to the following agencies and organizations for acceptance and retention in their permanent records:

- Hawaii State Archives
- University of Hawaii at Manoa
- Other local repositories available to the public and local community, such as the Liliha Public Library

II. PROJECT DESIGN REVIEW

A. HPHA shall invite SHPD and Concurring Party to participate in two internal design review meetings with HPHA, Developer and their architects, designers and consultants. One meeting shall be held during the schematic design phase and one meeting shall be held during the design development review phase of the Project. The two (2) design review meetings shall address potential issues or concerns to eligible historic properties with attention to establishing appropriate setbacks, bulk and mass envelopes, architectural detailing and articulation, and selected materials to minimize or mitigate potential adverse effect to directly adjacent eligible historic properties listed on Exhibit E ("Adjacent Eligible Properties") and to ensure consistent streetscape frontage transitions along commercial corridors of the Project, while respecting the existing scale and improvement features of adjacent Eligible Properties.

B. HPHA shall require Developer to deliver to SHPD Project plans for its review and comment prior to submitting Project plans for permit approval. SHPD shall agree to provide comments or concurrence with the Project plans submittal within fifteen (15) calendar days of receipt. If SHPD does not respond with comments or concurrence to the Project plans within fifteen (15) calendar days of delivery to SHPD, HPHA may assume SHPD's concurrence and move forward with the Project.

III. DOCUMENTARY FILM PRODUCTION FOR EDUCATIONAL PURPOSES

Prior to and during Project implementation, HPHA shall require Developer to produce a documentary film ("Documentary Film") recording the Mayor Wright Homes redevelopment effort and exploring and celebrating the unique history of Mayor Wright Homes to record and preserve its unique characteristics and significance with the Iwilei Kapalama community for future generations.

Documentary Film will be developed to be used for educational purposes as well as a documenting tool for the overall Project. Documentary Film shall include the following minimum parameters:

- Overall length of 10-20 minutes.
- At least two (2) oral histories of current or former Mayor Wright Homes residents
- Completed no later than 36 months after occupancy of Phase 1 of the Project.
- HPHA and Developer will present the Documentary Film at a public screening;
- Copies of the Documentary Film shall be distributed to the following agencies and organizations for acceptance and retention in their permanent records and where it may be made available for public access and viewing:
    - Hawaii State Archives
    - University of Hawaii at Mānoa
    - Historic Hawaii Foundation
    - Other local repository available to the public and local community, such as the Liliha Public Library

IV. COMMUNITY EDUCATION

A. HPHA shall require Developer to develop an interpretative plan that provides the framework for the content, design, manufacturing specifications and installation parameters for interpretive displays ("Interpretive Plan"). Interpretive Plan shall include the locations, dimensions, materials, general appearance and content of interpretive signs and displays. HPHA shall require Developer to use qualified professionals in architectural history and/or historic architecture to prepare Interpretive Plan.

Interpretive materials shall include:

- A summary of the Liliha/Palama neighborhood
- Native Hawaiian history within the Liliha/Palama neighborhood
- A summary of the historic aspects of Mayor Wright Homes and its significance as Public Housing community
- Identification of other eligible historic sites in the Liliha/Palama neighborhood and their significance to the community

B. HPHA shall require Developer to develop the Interpretive Plan through consultation with the signatories and Concurring Party, to include:

- HPHA shall distribute drafts of Interpretive Plan to Signatory Parties and Concurring Party during the preliminary, interim and pre-final stages of development of the Interpretive Plan for review and comment.

- Signatory Parties and Concurring Party shall agree to provide written comments to the drafts of the Interpretive Plan within 30 calendar days of receipt of the drafts. Any Signatory Party or Concurring Party may request a meeting to discuss the materials within the 30 calendar day review period.

- HPHA shall require Developer to address any comments received to the Interpretive Plan.

- HPHA shall require Developer to provide electronic copies of the final Interpretative Plan to Signatory Parties and Concurring Party within 60 calendar days of completion. ("Final Interpretive Plan").

C. Prior to construction completion of each phase of the Project, HPHA shall require Developer to construct and install interpretive materials in accordance with the Final Interpretative Plan. HPHA shall require Developer to design, manufacture and install no fewer than five (5) historic interpretive signs and displays in accordance with the Final Interpretive Plan by the time of occupancy of Phase 1 of Project.

V. PROJECT CONSTRUCTION

Prior to commencement of construction of each phase of the Project, HPHA shall require Developer

to complete a pre-construction inspection survey ("Inspection Survey") of the Eligible Properties to document baseline conditions for those Eligible Properties and to retain a Historic Architect who meets the Qualifications Standards to complete Inspection Survey.

Prior to commencement of construction of each phase of the Project, HPHA shall require Developer to submit a Noise and Vibration Control Plan, for implementing noise and vibration control measures to address protection measures prior to the commencement of any construction near the Eligible Properties. Suggested Noise and Vibration control measures shall include:

- The use of original equipment manufacturer (OEM) or high-performance mufflers on excavating and drilling equipment.
- Construction machinery to be regularly inspected and maintained.
- Machinery in use on-site will be limited to the minimum necessary.
- Noisier activities to be completed off-site until infeasible or impossible.
- Proper machinery usage and power to be employed – no machinery overkill.
- Noise barriers and machinery enclosures to be used where feasible.
- Spatial elements of adjacent historic buildings.

VI. ARCHAEOLOGICAL MONITORING OF GROUND DISTURBING ACTIONS

Prior to commencement of construction of the Project, HPHA shall require Developer to prepare and submit to SHPD for its review and approval an Archaeological Monitoring Plan ("Approved AMP") meeting the requirements of Hawaii Administrative Rules ("HAR") §13-279-4. All ground-disturbing work shall proceed in accordance with Approved AMP.

VII. POST-REVIEW DISCOVERIES

In the event that non-burial historic properties (e.g., cultural deposit, artifact concentration) or human burial or skeletal remains are encountered following completion of archaeological monitoring, HPHA shall require Developer to cease all work, secure the find, and promptly notify SHPD. In the case of human remains, HPHA shall require the developer to also notify the Honolulu Police Department. HPHA shall require Developer to comply with HAR Chapter 13-280 and SHPD directives for the documentation and treatment for non-burial historic properties, and to comply with HRS 6E-43.6, HAR § 13-300-40, and SHPD directives for the documentation and treatment of human burial or skeletal remains.

VIII. MONITORING AND REPORTING

Each year following the execution of this Agreement, until it expires or is terminated, HPHA shall require Developer to provide Signatory Parties and Concurring Party a summary written report detailing work undertaken with respect to the Project, scheduling changes proposed that may materially affect the overall timing or schedule of the Project, problems encountered including any adverse effect to Eligible Properties or other obligations hereunder. A meeting to discuss the annual report or any implementation item will be held at the request of any Signatory Party or Concurring Party to facilitate review and comment of the annual report, to resolve questions, or to resolve adverse conditions.

IX. DURATION

If the terms of this Agreement have been fully implemented by twelve (12) years from the date of the execution of this Agreement, or HPHA's receipt of certificate of occupancy for the final phase of the Project, this Agreement will terminate. Prior to termination of the Agreement, HPHA, at its sole discretion may, or may require Developer to, consult with the other Signatory Parties and Concurring Party to review the terms of the Agreement and amend the Agreement in accordance with Stipulation XI below. In the event the terms of this Agreement have not been fully implemented by twelve (12) years from the date of the execution of this Agreement, HPHA shall notify Signatory Parties and Concurring Party, and if, in its sole discretion, it chooses to continue with the undertaking, shall re-initiate review of the undertaking in accordance with 36 CFR Part 800.

X. DISPUTE RESOLUTION

Should any Signatory Party or Concurring Party to this Agreement, with the exception of Developer, object at any time to any actions proposed or the manner in which the terms of this Agreement are implemented, HPHA shall bring the matter to the Governor, including HPHA's recommendation and proposed resolution, and with the Governor's approval, consult with such party to resolve the objection. If HPHA determines that such objection cannot be resolved, HPHA will:

A. Forward all documentation relevant to the dispute, including HPHA's proposed resolution, to the Governor, and upon the Governor's approval, forward same to ACHP on behalf of the Governor. ACHP shall provide HPHA with its advice on the resolution of the objection within thirty (30) calendar days of receiving adequate documentation. Prior to reaching a final decision on the dispute, HPHA shall prepare a written response for the Governor's approval that takes into account any timely advice or comments regarding the dispute from ACHP, Signatory Parties and Concurring Party, and provide them with a copy of this written response. HPHA will proceed according to the Governor's final decision.

B. If ACHP does not provide its advice regarding the dispute within the thirty (30) calendar day time period, HPHA may proceed according to the Governor's final decision.

C. Any terms of this Agreement that are not subject to dispute shall remain unchanged and in full force and effect.

XI. AMENDMENTS

This Agreement may be amended when such an amendment is agreed to in writing by all Signatory Parties and Concurring Party. Such amendment shall be effective the date such amendment is executed by Signatory Parties and Concurring Party and delivered electronically to the ACHP.

XII. TERMINATION

If any Signatory Party to this Agreement, other than Developer, determines that its terms will not or cannot be carried out, that party shall immediately consult with the other signatories, Invited Signatory and Concurring Party to attempt to develop an amendment per Stipulation XI, above. If within thirty (30) calendar days an amendment cannot be reached, any signatory may terminate the Agreement upon written notification to the other signatories.

Once the Agreement is terminated, and prior to work continuing on the undertaking, HPHA must either execute an agreement pursuant to 36 CFR § 800.6 or request, take into account, and respond to comments of ACHP under 36 CFR § 800.7; provided, however, nothing herein shall be construed to require HPHA to halt construction and related activities proceeding in accordance with this Agreement initiated prior to the termination of this Agreement. HPHA shall notify the signatories of action it will pursue. Any new agreement pursuant to 36 CFR § 800.6 or action based under 36 CFR § 800.7 shall apply solely to activities initiated after the termination of this Agreement.

Execution of this Agreement by HPHA and SHPD and implementation of its terms evidence HPHA has taken into account the effects of the undertaking on historic properties.

XIII. MISCELLANEOUS

A. Formal notices and communication between Signatory Parties or Concurring Party shall be sufficiently given if, and shall not be deemed given unlesssent to the e-mail addresses of the signatories shown as follows, or such other address as the signatory may designate in writing from time to time:

STATE OF HAWAII:
The Honorable David Y. Ige
Governor of the State of Hawaii
Office of the Governor, State of Hawaii
415 S. Beretania Street, Honolulu, HI 96813
Attention: Sara Lin, Senior Special Assistant

HHF:
Historic Hawaii Foundation
680 Iwilei Road, Ste. 690
Honolulu, HI 96817
Attn: Kiersten Faulkner, Executive Director
Email address: kiersten@historichawaii.org

B. This Agreement may be executed in counterparts, each of which shall be deemed an original but all of which together shall constitute one and the same agreement.

C. Notwithstanding anything to the contrary herein, the duties and obligations of Developer under this Agreement shall be binding on all Housing Owners and Commercial Owners, as such terms are defined in the MDA, through incorporation by reference in DDAs to be entered into in accordance with the MDA and the Authority Closing Documents as such terms are defined in the MDA. However, nothing in this Agreement shall be construed to limit the HPHA's right to terminate the Developer under the MDA pursuant to the MDA or to limit the HPHA's right to determine that any Housing Owner or Commercial Owner is in default under the Authority Closing Documents pursuant to the terms of the Authority Closing Documents.

Advisory Council on Historic Preservation
Notice of Election Not to Participate in Consultation

Exhibit D

Preserving America's Heritage

October 25, 2018

Mr. Hakim Ouansafi
Executive Director
Hawaii Public Housing Authority
1002 North School Street
Honolulu, HI 96817

Ref: *Proposed Demolition and Redevelopment of the Mayor Wright Homes located on North Kukui Street Island of O'ahu, Hawaii*
ACHPConnect Log Number: 13262

Dear Mr. Ouansafi:

The Advisory Council on Historic Preservation (ACHP) has received your notification and supporting documentation regarding the adverse effects of the referenced undertaking on a property or properties listed or eligible for listing in the National Register of Historic Places. Based upon the information provided, we have concluded that Appendix A, *Criteria for Council Involvement in Reviewing Individual Section 106 Cases*, of our regulations, "Protection of Historic Properties" (36 CFR Part 800), does not apply to this undertaking. Accordingly, we do not believe that our participation in the consultation to resolve adverse effects is needed. However, if we receive a request for participation from the State Historic Preservation Officer (SHPO), Tribal Historic Preservation Officer (THPO), affected Indian tribe, a consulting party, or other party, we may reconsider this decision. Additionally, should circumstances change, and it is determined that our participation is needed to conclude the consultation process, please notify us.

Pursuant to 36 CFR §800.6(b)(1)(iv), you will need to file the final Memorandum of Agreement (MOA), developed in consultation with the Hawaii State Historic Preservation Officer (SHPO), and any other consulting parties, and related documentation with the ACHP at the conclusion of the consultation process. The filing of the MOA, and supporting documentation with the ACHP is required in order to complete the requirements of Section 106 of the National Historic Preservation Act.

Thank you for providing us with the notification of adverse effect. If you have any questions or require further assistance, please contact Anthony G. Lopez at (202) 517-0220 or by email at alopez@achp.gov.

Sincerely,

LaShavio Johnson

June 25, 2018

MEMORANDUM

TO: The Honorable David Y. Ige
Governor, State of Hawaii

THROUGH: Pankaj Bhanot, Director
Department of Human Services

FROM: Hakim Ouansafi, Executive Director
Hawaii Public Housing Authority

SUBJECT: Request for the Governor as Agency Official Under Section 106 National Historic Preservation Act to Establish Mayor Wright Homes Redevelopment Project as an "Undertaking"; and Authorize HPHA to Conduct Consultation And Inform the State Historic Preservation Officer Of Such Authorization

Proposed Redevelopment Project
The Hawai'i Public Housing Authority ("HPHA") is evaluating the potential redevelopment of the Mayor Wright Homes public housing development located at 521 North Kukui Street, Oahu, Honolulu Tax Map Key ("TMK") (1) 1-7-029:003 ("Site"). The overall redevelopment program would include applying to the U.S. Department of Housing and Urban Development ("HUD") to raze the existing structures and redevelop the site as a mixed-income, mixed-use housing development (the "Project"). The proposed Project will total approximately 2,448 residential rental units; approximately two-thirds of which shall be affordable units, including the replacement of the existing 364 public housing units on site, on a one-for-one basis with similarly deeply subsidized units. In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

The Mayor Wright Homes redevelopment will not only improve housing conditions for its current residents, but will fundamentally transform an existing, six-decade old, state-owned land asset, into a new, mixed-income, mixed-use, transit oriented development

enhancing the existing vibrant Kalihi, Liliha, Kapālama, and Iwilei communities. The Project will facilitate the delivery of urgently needed new rental housing units to help address the existing affordable rental housing crisis across the State of Hawai'i. The HPHA has entered into a public/private partnership with MWH Partners, LLC, its affiliates and consultants ("Hunt") to execute the Project.

Purpose of the Request
HPHA is evaluating utilizing available funding pursuant to the Housing Act of 1937, as amended, to assist in the construction of Replacement Units and to contribute toward the operation of the Replacement Units with either public housing operating subsidy and/or project based vouchers. Because these proposed funding sources would include federal funding or grants, the proposed Project is considered a federal action or "Undertaking".

Accordingly, the Undertaking is required to comply with the National Environmental Policy Act ("NEPA") and the National Historic Preservation Act of 1966, as amended ("NHPA") and its implementing regulations at 36 CFR Part 800 (the "Federal Regulations") (attached as Exhibit A). Section 800.2 of the Federal Regulations defines the Participants in the Section 106 process as follows:

> 800.2 (a) ***Agency official***. It is the statutory obligation of the Federal agency to fulfill the requirements of section 106 and to ensure that an agency official with jurisdiction over an undertaking takes legal and financial responsibility for section 106 compliance in accordance with subpart B of this part. The agency official has approval authority for the undertaking and can commit the Federal agency to take appropriate action for a specific undertaking as a result of section 106 compliance. For the purposes of subpart C of this part, the agency official has the authority to commit the Federal agency to any obligation it may assume in the implementation of a program alternative. The agency official may be a State, local, or tribal government official who has been delegated legal responsibility for compliance with section 106 in accordance with Federal law.
>
> 800.2 (a)(3) ***Use of contractors***. Consistent with applicable conflict of interest laws, the agency official may use the services of applicants, consultants, or designees to prepare information, analyses and recommendations under this part. The agency official remains legally responsible for all required findings and determinations. If a document or study is prepared by a non-Federal party, the agency official is responsible for ensuring that its content meets applicable standards and guidelines.
>
> 800.2 (c) ***Consulting Parties***: the following Parties have consultative roles in the Section 106 Process.
>
> (1) *State Historic Preservation Officer*. (i)The State historic preservation officer (SHPO) reflects the interests of the State and its citizens in the preservation of their cultural heritage.

(2) *Indian tribes and Native Hawaiian organizations.* (ii) Consultation on historic properties of significance to Indian tribes and Native Hawaiian organizations. Section 101(d)(6)(B) of the act requires the agency official to consult with any Indian tribe or Native Hawaiian organization that attaches religious and cultural significance to historic properties that may be affected by an undertaking. This requirement applies regardless of the location of the historic property. Such Indian tribe or Native Hawaiian organization shall be a consulting party.

(3) *Representatives of local governments.*

(4) *Applicants for Federal assistance, permits, licenses, and other approvals.* An applicant for Federal assistance or for a Federal permit, license, or other approval is entitled to participate as a consulting party as defined in this part. The agency official may authorize an applicant or group of applicants to initiate consultation with the SHPO/ THPO and others, but remains legally responsible for all findings and determinations charged to the agency official. The agency official shall notify the SHPO/THPO when an applicant or group of applicants is so authorized. A Federal agency may authorize all applicants in a specific program pursuant to this section by providing notice to all SHPO/THPOs. Federal agencies that provide authorizations to applicants remain responsible for their government-to-government relationships with Indian tribes.

HUD has unique legislative authority, as specified in several statutes, including the Housing and Community Development Act of 1974, as amended, that allows State, Tribal, and local governments ("responsible entities" or REs) to assume responsibility for all of HUD's environmental requirements in a number of HUD programs. This has been codified in 24 CFR Part 58, "Environmental Review Procedures for Entities Assuming HUD Environmental Responsibilities." Within Part 58, Sections 106 and 110 of the National Historic Preservation Act and 36 CFR Part 800 are identified as specific requirements that may be assumed by the RE. As noted in various subsections of 36 CFR Part 800, including §800.2(a) above, REs are the "agency official" for the purposes of Section 106. HUD may provide technical assistance or otherwise facilitate Section 106 agreements for REs. However, as noted above, HUD is not a signatory to those agreements. The legal responsibility lies with the RE. (See HUD Environmental Regulations and Section 106 Agreement Documents Memo Dated Sep 21, 2005 attached as Exhibit B).

In order to initiate the NHPA Section 106 process and to comply with Federal Regulations, pursuant to 36 CFR § 800.3 for the Project the agency official should do the following:

A) § 800.3 (a) *Establish undertaking.* The agency official shall determine whether the proposed Federal action is an undertaking as defined in § 800.16 (y) and, if

so, whether it is a type of activity that has the potential to cause effects on historic properties.

B) § 800.3 (c) (3) Conducting consultation. The agency official should consult with the SHPO/THPO in a manner appropriate to the agency planning process for the undertaking and to the nature of the undertaking and its effects on historic properties.

Since the proposed Project will involve demolition of the existing buildings on the Project Site, which themselves have been identified as eligible for listing on a historic register, the HPHA anticipates/acknowledges that proposed Project will ultimately result in a determination of "adverse effect" with regard to historic architectural resources.

This consultation will further include identifying organizations who may have an interest in the Project and its potential to affect historic properties, including Native Hawaiian Organizations and Native Hawaiian descendants who may have ancestral lineal or cultural ties, knowledge, or religious attachment to the Project Site or concerns regarding the proposed Project ("Consulting Parties").

Accordingly, the HPHA requests the agency official to take the following actions:

1. Establish the Mayor Wright Homes Redevelopment Project as an "Undertaking"; and

2. Authorize the HPHA, MWH Partners, LLC, its affiliates and consultants to initiate and conduct consultation with the SHPO/THPO and other consulting Parties pursuant to 800.2 (c) (4) (referenced above), to prepare information, analyses and recommendations pursuant to 36 CFR 800.2 (a)(3) (referenced above).

Upon your approval, a copy of this authorization will be delivered to the SHPO/SHPO pursuant to 800.2 (c)(4) to start the consultation process.

If you have any questions or concerns regarding this matter, please contact Hakim Ouansafi, Executive Director at (808) 832-4682.

MEMORANDUM:

TO: The Honorable David Y. Ige
Governor, State of Hawaii

THROUGH: Pankaj Bhanot, Director
Department of Human Services Pankaj Bhanot.

FROM: Hakim Ouansafi, Executive Director
Hawaii Public Housing Authority

SUBJECT: Request for the Governor as Agency Official Under Section 106 National Historic Preservation Act to Identify an Effect Determination Regarding the Mayor Wright Homes Redevelopment Project Undertaking
REFERENCES: 18:OED/32

Requested Action:

The HPHA hereby respectfully requests the Agency Official to take the following action:

(1) identify and apply a finding of "*Adverse Effect*" for the Mayor Wright Homes Redevelopment Project pursuant to § 800.5(a)(1) so that the HPHA may continue the consultation process, determine mitigation to address and resolve the adverse effect, and memorialized the proposed mitigation in the form of a MOA pursuant to §800.6 that the HPHA may recommended to the Agency Official for acceptance and execution.

Background and Purpose of the Request

In our Memorandum Dated June 25, 2018 (18:OED/32-attached), the Hawai'i Public Housing Authority ("HPHA") stated that we are evaluating the potential redevelopment of the Mayor Wright Homes public housing development located at 521 North Kukui Street, Oahu, Honolulu Tax Map Key ("TMK") (1) 1-7-029:003 ("Site"). The overall redevelopment program would include applying to the U.S. Department of Housing and Urban Development ("HUD") to raze the existing structures and redevelop the site as a mixed-finance, mixed-use housing development (the "Project"). The proposed Project will total approximately 2,448 residential rental units; approximately two-thirds of which shall be affordable units, including the replacement of the existing 364 public housing units on site, on a one-for-one basis, with similarly deeply subsidized units. In addition, up to 80,000 square feet of commercial space is also proposed for the Project, which may include a mix of retail, office space, and community services to support the new residential units and complement the surrounding neighborhood.

As the HPHA plans to leverage federal funding for the proposed Project, the Project is required to comply with the National Historic Preservation Act of 1966 and Section 106, as amended ("NHPA"). HPHA's June 25, 2018 memorandum (18:OED/32) requested the Agency Official to (i) declare the MWH project an "*Undertaking*" pursuant to §800.2 and (ii) authorize the HPHA, its development partner and their consultants to initiate and conduct consultation with the State Historic Preservation Officer ("SHPO") and other consulting parties as allowed under §800.2 (a)(3). Additionally, because the Project will involve the demolition of the existing buildings on the Project Site, which have been identified as eligible for listing on a historic register, the HPHA informed the Agency Official that the redevelopment will ultimately result in a determination of "adverse effect" with regard to historic architectural resources.

The HPHA, having continued consultation with the SHPO, and other identified consulting parties requested consulting party status pursuant to §800.3 (f), recommends that the Agency Official identify and apply a finding of "*Adverse Effect*" for the Mayor Wright Homes Redevelopment Project pursuant to §800.5(a)(1). Once a determination of Adverse Effect has been made, the HPHA shall continue the consultation process to develop proposed mitigation to address and resolve the Adverse Effect so that agreed upon mitigation measures may be memorialized in a Memorandum of Agreement (MOA) with the SHPO and other invited signatories, pursuant to § 800.6, which the HPHA will then recommended to the Agency Official for acceptance and execution.

In July 2018, the HPHA, and its development partner, prepared and delivered over 100 letters of invitation and accompanying background materials describing the proposed Project to organizations and individuals with a potential interest in the proposed undertaking and its potential to affect historic properties. This list included all Native Hawaiian Organizations identified on the *Native Hawaiian Organization Notification List* published by the U.S. Department of the Interior, and maintained by the Office of Native Hawaiian Relations, to identify any Native Hawaiian Organizations and/or Native Hawaiian descendants who may have ancestral lineal or cultural ties, knowledge, or

religious attachment or concerns regarding the proposed undertaking. The letters of invitation were delivered on July 18, 2018 with a response requested within 30 days. Three parties responded to the letter of invitation and, of these, only the Historic Hawaii Foundation, expressed a desire to participate in consultation as a consulting party.

On October 9, 2018, after all prospective consulting parties and Native Hawaiian Organizations had been identified, contacted and provided sufficient opportunity to respond, the HPHA then (i) notified the Advisory Council on Historic Preservation (ACHP) and provided supporting documentation regarding the adverse effects of the proposed undertaking on a property or properties listed or eligible for listing in the National Register of Historic Places and (ii) invited the ACHP to participate in consultation as required pursuant to §800.6 (a)(1). On October 25, 2018, the HPHA received a response from the ACHP acknowledging the notification and submission of supporting documentation regarding the adverse effects of the referenced undertaking. After review, the ACHP concluded that Appendix A, Criteria for Council Involvement in Reviewing Individual Section 106 Cases pursuant to "Protection of Historic Properties" under 36 CFR 800, did not apply to this undertaking. Accordingly, ACHP determined that its participation in the consultation to resolve adverse effects was not required.

HPHA wishes to continue consultation with the SHPD and Historic Hawaii Foundation, as identified consulting parties, with the objective of considering and proposing mitigation measures to address the adverse effect determination. Final agreed upon mitigation measures will then be documented in a final MOA that the HPHA will present and recommend to the Agency Official for acceptance/execution. Once accepted by the Agency Official, the executed MOA will be included in the Environmental Assessment for the Project being prepared pursuant to the National Environmental Protection Act to evidence Section 106 compliance. The HPHA, on behalf of the Agency Official, will also file the final MOA and related supporting documentation with the ACHP upon conclusion of the consultation process, pursuant to §800.6(b)(1)(iv), which will complete the NHPA compliance requirements required for the undertaking.

To initiate the MOA process for the undertaking pursuant to §800.6, the Agency Official, pursuant to § 800.5(a)(1), should *Apply the criteria of adverse effect*. An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Since the undertaking will involve the demolition of the existing buildings on the Project Site, which themselves have been identified as eligible for listing on a historic register, a determination of "adverse effect" with regard to historic architectural resources is warranted.

Upon your approval, the HPHA shall also provide a copy of this authorization to the SHPO.

If you have any questions or concerns regarding this matter, please contact Hakim Ouansafi, Executive Director at (808) 832-4682.

1.0 SUMMARY OF FINDINGS

Terry A. Hayes Associates Inc. has completed a Noise Study for the Mayor Wright Homes Redevelopment Project (proposed project). Key findings are listed below.

- Construction activity would result in temporary increases in ambient noise levels in the project area on an intermittent basis. Construction noise levels would exceed the allowable noise levels listed in the Hawaii State Department of Health *Noise Reference Manual Oahu Edition* and the Hawaii Administrative Rules. Therefore, without noise control, the proposed project would result in an adverse effect related to construction noise. The following noise control measures would eliminate adverse effects.

  N1 The project applicant shall obtain a noise permit associated with exceeding a noise level of 78 dBA L_{eq} as discussed in the *Noise Reference Manual Oahu Edition*.

  N2 The project applicant shall obtain a noise permit associated with exceeding the maximum permissible noise levels discussed in the Hawaii Administrative Rules.

  N3 The construction contractor shall use specialty equipment with enclosed engines and/or high-performance mufflers.

  N4 The construction contractor shall locate equipment and staging areas as far from noise-sensitive receivers as practicable.

  N5 The construction contractor shall limit unnecessary idling of equipment.

  N6 The construction contractor shall install temporary noise barriers to enclose stationary noise sources, such as compressors, generators, laydown and staging areas, and other noisy equipment.

  N7 Prior to the commencement of construction activities, notification shall be provided to the on-site residential uses that discloses the construction schedule, including the various types of activities and equipment that would be occurring throughout the duration of the construction period.

  N8 A “noise disturbance coordinator” shall be established. The noise disturbance coordinator shall be responsible for responding to any local complaints about construction noise. The noise disturbance coordinator shall determine the cause of the noise complaint (e.g., starting too early, bad muffler, etc.) and shall be required to implement reasonable measures such that the complaint is resolved. All notices that are posted at the construction site shall list the telephone number for the noise disturbance coordinator.

- Construction activity can result in varying degrees of ground-borne vibration, depending on the equipment and methods employed. Construction vibration levels would not exceed the relevant standards. Therefore, the proposed project would result in an adverse effect related to construction vibration without vibration control measures. The following vibration control measure would eliminate adverse effects.

  N9 Prior to issuance of a grading/shoring permit, a qualified structural engineer shall survey the existing foundation and structural integrity of off-site buildings that will be located within 11 feet of large bulldozers and similar vibration-generating equipment and at the Fuji Store and Tenement Houses. The survey shall be submitted to the

  appropriate mitigation monitor. At the conclusion of vibration causing activities, the qualified structural engineer shall issue a follow-on letter describing damage, if any, to the adjacent buildings. The letter shall identify recommendations for any repair, and certify the completion of any repairs as necessary to confirm the integrity of the foundation and structure of the adjacent buildings.

  N10 If the construction plans call for high-vibration construction activities being performed close to structures, the contractor may be required to use alternative procedures that produce lower vibration levels. Examples of high-vibration construction activities include the use of pavement breakers, vibratory compaction, and hoe rams next to sensitive buildings. Alternative procedures shall include the use of non-vibratory compaction in limited areas and concrete saws in place of jackhammers or pavement breakers for demolition.

  N11 If piles are required to support new structures, pile driving shall be prohibited in place of cast-in-drilled-hole (CIDH) piles or caissons.

- Stationary noise sources would potentially exceed the Hawaii Administrative Rules maximum permissible noise levels. Therefore, without noise control, the proposed project would result in an adverse effect related to stationary noise. The following noise control measures would eliminate adverse effects.

  N12 The project applicant shall require mechanical equipment (e.g., ventilation and air conditioning systems) to be enclosed such that noise levels do not exceed the maximum permissible noise levels listed in the Hawaii Administrative Rules.

- Mobile source noise levels would not exceed the 5-dBA operational mobile source noise criteria. Therefore, the proposed project would not result in adverse effects related to off-site vehicular noise.

- The proposed project would not include significant stationary sources of ground-borne vibration. Vibration would be similar to existing conditions and project-related traffic vibration levels would not be perceptible outside the roadway right-of-way. Therefore, the proposed project would not result in adverse effect related to the operational vibration.

2.0 INTRODUCTION

2.1 PURPOSE

The purpose of this report is to evaluate the potential for noise and vibration impacts associated with the proposed project. Potential noise levels are analyzed for construction and operational activities. Noise control measures for potentially adverse effects are recommended when appropriate to reduce noise and vibration levels.

2.2 PROJECT DESCRIPTION

The proposed project would redevelop the existing Mayor Wright Housing on Liliha Street in Honolulu, Hawaii. The existing 15-acre project site includes 364 affordable housing units. The proposed mixed-use development includes up to 2,500 residential units and up to 80,000 square feet of retail and commercial uses. The proposed project would also incorporate a community park, pedestrian mews, a multi-purpose hall, and a community center.

The project site is located in the Kalihi community on the island of Oahu. The site is bounded by North King Street on the southwest, Vineyard Boulevard on the northeast, Pua Lane on the northwest, and Liliha Street on the southeast. The H-1 freeway is located east of the site and would provide residents living in the future project with access to jobs in Kapolei, Pearl City, Aiea and Pearl Harbor, as well as areas Diamond Head of downtown Honolulu.

The location of the proposed project is shown in **Figure 2-1** and the site plan is shown in **Figure 2-2**.

3.0 NOISE AND VIBRATION CHARACTERISTICS AND REGULATIONS

3.1 NOISE

Characteristics of Sound

Sound is technically described in terms of the loudness (amplitude) and frequency (pitch) of the sound. The standard unit of measurement for sound is the decibel (dB). The human ear is not equally sensitive to sound at all frequencies. The "A-weighted scale," abbreviated dBA, reflects the normal hearing sensitivity range of the human ear. On this scale, the range of human hearing extends from approximately 3 to 140 dBA. **Figure 3-1** provides examples of A-weighted noise levels from common sounds.

Noise Definitions

This noise analysis discusses sound levels in terms of Equivalent Noise Level (L_{eq}) and Day-Night Noise Level (L_{dn}).

Equivalent Noise Level (L_{eq}). L_{eq} is the average noise level on an energy basis for any specific time period. The L_{eq} for one hour is the energy average noise level during the hour. The average noise level is based on the energy content (acoustic energy) of the sound. L_{eq} can be thought of as the level of a continuous noise which has the same energy content as the fluctuating noise level. The equivalent noise level is expressed in units of dBA.

Day-Night Noise Level (L_{dn}). L_{dn} is basically a 24-hour L_{eq} with an adjustment to reflect the greater sensitivity of most people to nighttime noise. The adjustment is a 10-dBA penalty for all sound that occurs in the nighttime hours of 10:00 p.m. to 7:00 a.m. The effect of the penalty is that in the calculation of L_{dn}, any event that occurs during the nighttime hours is equivalent to ten of the same event during the daytime hours.

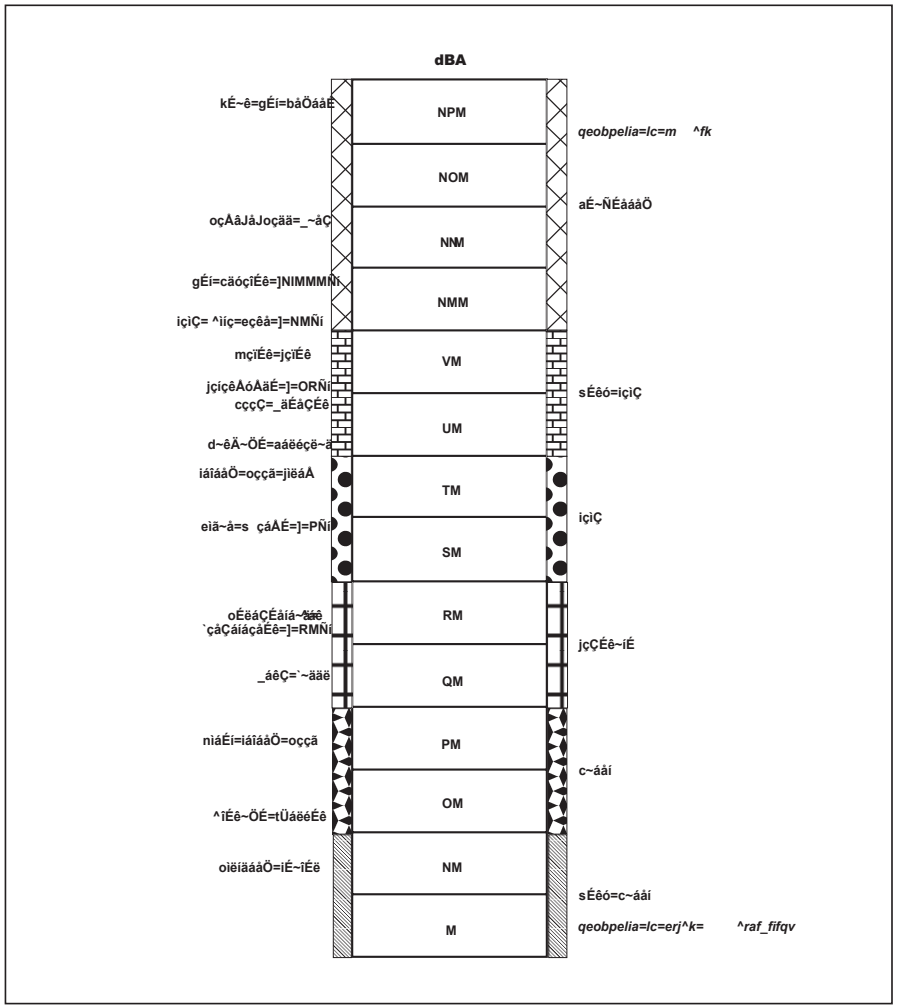
Effects of Noise

Noise is generally defined as unwanted sound. The degree to which noise can impact the human environment ranges from levels that interfere with speech and sleep (annoyance and nuisance) to levels that cause adverse health effects (hearing loss and psychological effects). Human response to noise is subjective and can vary greatly from person to person. Factors that influence individual response include the intensity, frequency, and pattern of noise, the amount of background noise present before the intruding noise, and the nature of work or human activity that is exposed to the noise source.

Audible Noise Changes

Studies have shown that the smallest perceptible change in sound level for a person with normal hearing sensitivity is approximately 3 dBA. A change of at least 5 dBA would be noticeable and would likely evoke a community reaction. A 10-dBA increase is subjectively heard as a doubling in loudness and would cause a community response.

Noise levels decrease as the distance from the noise source to the receiver increases. Noise generated by a stationary noise source, or "point source," will decrease by approximately 6 dBA over hard surfaces (e.g., reflective surfaces such as parking lots or smooth bodies of water) and 7.5 dBA over soft surfaces (e.g., absorptive surfaces such as soft dirt, grass, or scattered bushes and trees) for each doubling of the distance.



For example, if a noise source produces a noise level of 89 dBA at a reference distance of 50 feet, then the noise level would be 83 dBA at a distance of 100 feet from the noise source, 77 dBA at a distance of 200 feet, and so on. Noise generated by a mobile source will decrease by approximately 3 dBA over hard surfaces and 4.5 dBA over soft surfaces for each doubling of the distance.

Generally, noise is most audible when traveling by direct line-of-sight.[1] Barriers, such as walls, berms, or buildings that break the line-of-sight between the source and the receiver greatly reduce noise levels from the source since sound can only reach the receiver by bending over the top of the barrier (diffraction). Sound barriers can reduce sound levels by up to 20 dBA. However, if a barrier is not high or long enough to break the line-of-sight from the source to the receiver, its effectiveness is greatly reduced.

Applicable Regulations

United States Housing and Urban Development (HUD). HUD has a stated goal to provide "a decent home and suitable living environment for every American family." HUD regulations state that acceptable exterior noise levels are 65 L_{dn} or less, normally unacceptable exterior noise levels are between 65 and 75 L_{dn} (to achieve an acceptable status, appropriate sound attenuation measures must be provided), and unacceptable noise levels exceed 75 L_{dn}. HUD's regulations do not contain standards for interior noise levels. Rather, a goal of 45 dBA L_{dn} is set forth and the attenuation requirements are geared towards achieving that goal. It is assumed that with standard construction, any building will provide sufficient attenuation so that if the exterior level is 65 L_{dn} or less, the interior level will be 45 L_{dn} or less. HUD offers three suggestions for mitigating high noise levels on residential projects, including relocation, erecting barriers, and using noise control designs on the building's exterior.

Federal Aviation Administration (FAA). The FAA has published land use compatibility guidelines that can be used to assess potential noise impacts to new development projects.[2] The guidelines indicate that residential land uses exposed to aircraft-related noise levels of less than 65 dBA L_{dn} are compatible with the ambient noise environment. Where the community determines that residential or school uses must be allowed, measures to achieve outdoor to indoor noise level reduction of at least 25 dBA and 30 dBA should be incorporated into building codes and be considered in individual approvals.

Hawaii Statutes. Chapter 342F, of the Hawaii Revised Statutes contains standards and guidelines to address noise pollution. The Department has adopted a state community noise code pursuant to Chapter 91, which recognizes differences in noise level standards in urban and non-urban areas of the State and noise level standards of each county. The community noise codes are the relevant standards for analysis of noise pollution and impacts.

Noise Reference Manual Oahu Edition. The Hawaii State Department of Health *Noise Reference Manual Oahu Edition* discusses local rules for various noise sources. Relevant information includes a discussion of construction noise. A Community Noise Permit is required for construction projects exceeding 78 dBA or that has a total cost of more than $250,000 (based on the value on the building permit). Construction is allowed from 7:00 a.m. to 6:00 p.m., Monday through Friday, and 9:00 a.m. to 6:00 p.m. on Saturdays. The use of certain demolition and construction equipment (such as pile drivers, hydraulic hammers, jackhammers, etc.) is limited to 9:00 a.m. to 5:30 p.m., Monday through Friday. Construction projects exceeding the

[1] Line-of-sight is an unobstructed visual path between the noise source and the noise receptor.
[2] FAA, *1050.1F Desk Reference, Chapter 11 - Noise and Noise-Compatible Land Use*, July 2015.

maximum permissible sound levels (78 dBA) before 7:00 a.m. and after 6:00 p.m., Monday through Friday, or before 9:00 a.m. and after 6:00 p.m. on Saturdays, or at any time on Sundays and holidays are allowed only with an approved Community Noise Variance issued by the State Department of Health.[3]

Hawaii Department of Health. The Hawaii Administrative Rules (HAR) includes a section on noise control (Title 11 - Department of Health, Chapter 46 – Community Noise Control). The purpose is to define maximum permissible sounds levels, and to provide for the prevention, control, and abatement of noise pollution in Hawaii from stationary noise, construction and agricultural equipment, and industrial activities. The maximum permissible sound levels are shown in **Table 3-1**. Backup alarm devices on construction equipment that is required by federal or State occupational safety and health regulations are exempt from complying with the maximum noise levels. The HAR also state that all construction equipment should include mufflers, except pile hammers and pneumatic hand tools.

The Director of the Department of Health may grant a permit to operate excessive noise sources that exceed the maximum permissible noise levels. The permit application should include, but is not limited to, an assessment of best available control technology and disclosure of nighttime impacts.

TABLE 3-1: MAXIMUM PERMISSIBLE SOUND LEVELS

Zoning District	Daytime (dBA) (7:00 a.m. to 10:00 p.m.)	Nighttime (dBA) (10:00 p.m. to 7:00 a.m.)
Class A	55	45
Class B	60	50
Class C	70	70

Notes:
Class A: Lands zoned residential, conservation, preservation, public space, open space, or similar type.
Class B: Lands zoned for multi-family dwellings, apartment, business, commercial, hotel, resort, or similar type.
Class C: Lands zoned agriculture, country, industrial, or similar type.
The sound levels apply to any excessive noise source emanating within the specified zoning district, and at any point at or beyond the property line.
Noise levels shall not exceed the maximum permissible sound levels for more than ten percent of the time within any twenty minute period, except by permit or variance.
For mixed zoning districts, the primary land use designation shall be used to determine the applicable zoning district.
The maximum permissible sound level for impulsive noise shall be ten dBA above the maximum permissible sound levels.
SOURCE: Hawaii Administrative Rules, Title 11, Chapter 45.

3.2 VIBRATION

Characteristics of Vibration

Vibration is an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. Vibration can be a serious concern, causing buildings to shake and rumbling sounds to be heard. In contrast to noise, vibration is not a common environmental problem. Some common sources of vibration are trains, buses on rough roads, and construction activities, such as blasting, pile driving, and heavy earth-moving equipment.

Vibration Definitions

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe vibration impacts to buildings and is usually measured in

[3]Hawaii State Department of Health, *Noise Reference Manual*, Oahu Edition, February, 2008.

inches per second. The root mean square (RMS) amplitude is most frequently used to describe the effect of vibration on the human body. The RMS amplitude is defined as the average of the squared amplitude of the signal. Decibel notation (Vdb) is commonly used to measure RMS. The decibel notation acts to compress the range of numbers required to describe vibration.[4]

Effects of Vibration

High levels of vibration may cause physical personal injury or damage to buildings. However, ground-borne vibration levels rarely affect human health. Instead, most people consider ground-borne vibration to be an annoyance that may affect concentration or disturb sleep. In addition, high levels of ground-borne vibration may damage fragile buildings or interfere with equipment that is highly sensitive to ground-borne vibration (e.g., electron microscopes).

Perceptible Vibration Changes

In contrast to noise, ground-borne vibration is not a phenomenon that most people experience every day. The background vibration velocity level in residential areas is usually 50 RMS or lower, well below the threshold of perception for humans which is around 65 RMS.[5] Most perceptible indoor vibration is caused by sources within buildings, such as operation of mechanical equipment, movement of people, or slamming of doors. Typical outdoor sources of perceptible ground-borne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If the roadway is smooth, the vibration from traffic is rarely perceptible.

Applicable Regulations

Neither the State of Hawaii nor the City and County of Honolulu has vibration standards. To counter the effects of ground-borne vibration, the Federal Transit Administration (FTA) has published guidance relative to vibration impacts. According to the FTA, engineered concrete and masonry buildings (no plaster) can be exposed to can be exposed to ground-borne vibration levels of 0.3 inches per second without experiencing structural damage. Non-engineered timber and masonry buildings can be exposed to ground-borne vibration levels of 0.2 inches per second and buildings extremely susceptible to vibration damage can be exposed to ground-borne vibration levels of 0.12 inches per second without experiencing structural damage.[6]

[6]*Ibid.*

4.0 EXISTING SETTING

4.1 EXISTING NOISE ENVIRONMENT

The surrounding area has a mix of mostly low-income rental units; various businesses including several gas stations, restaurants, and home improvement shops; and civic institutions, including several churches and schools such as Princess Victoria Ka'iulani Elementary School and Honolulu Community College across King Street and Kauluwela Elementary School across Vineyard Boulevard. Commercial uses southwest of Dillingham Boulevard include industrial office space, warehouses, machine shops, and food industries, while the area northeast of Dillingham include mostly residential with smaller commercial lots including fast food restaurants, gas stations, banks, and automotive shops.

Noise generators in the vicinity of the proposed project include nearby roadways, HNL and the H-1 Freeway. A suitable location for a 24-hour measurement on the project site was not identified so a series of short-term measurements were used to calculate the L_{dn}. This methodology is described on Page D-3 of the FTA Transit Noise and Vibration Impact Assessment guidance.[7] A series of 15-minute sound measurements were taken using a Type 1 SoundPro DL Sound Level Meter on Thursday April 27, 2017. Noise monitoring locations are shown in **Figure 4-1**. Measurements were taken adjacent to the project site for three different time periods: peak traffic from 8:00 a.m. to 9:00 a.m., midday from 11:00 a.m. to 12:00 p.m., and evening from 10:00 p.m. to 11:00 p.m. As shown in **Table 4-1**, the estimated L_{dn} ranges from 56.9 dBA to 67.8 dBA. The average 24-hour L_{dn} was 64.0 dBA. In addition to the four on-site measurements, four off-site measurements (Sites 5 through 8) were taken at nearby sensitive receptors between the hours of 12:00 p.m. and 1:00 p.m. As shown in **Table 4-1,** the hourly L_{eq} ranged from 54.7 dBA to 71.8 dBA.

TABLE 4-1: EXISTING MONITORED NOISE LEVELS

Key to Figure 4-1	Noise Monitoring Location	Noise Level (dBA, L_{eq})			Noise Level (dBA, L_{dn})
		Peak Traffic	Midday	Evening	
1	Project Boundary (Vineyard Blvd.)	71.4	71.0	66.1	67.8
2	Project Boundary (Liliha St.)	68.0	67.8	61.3	64.3

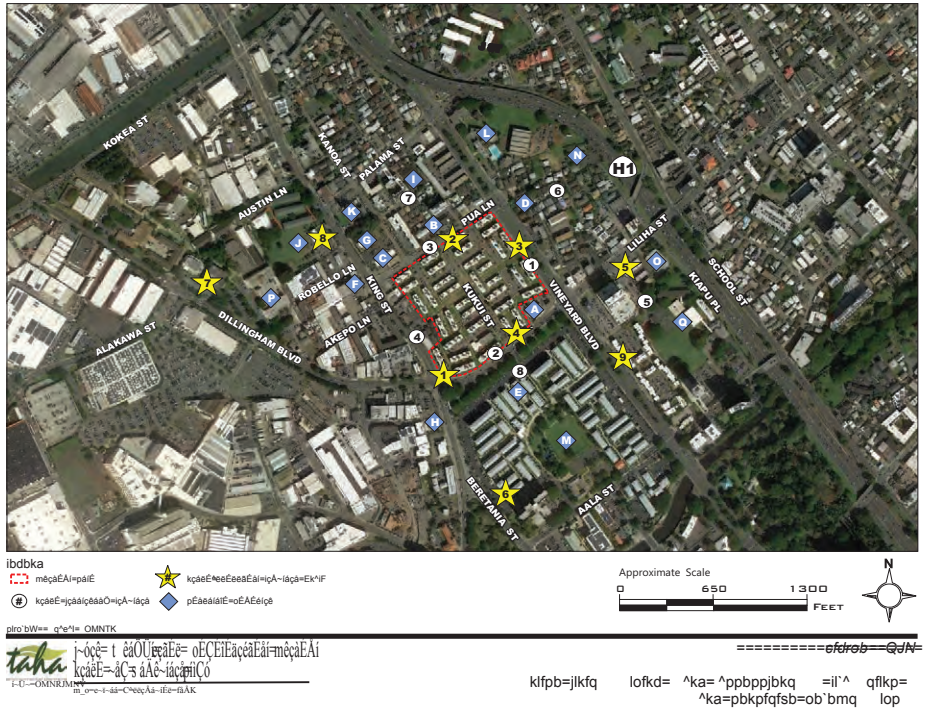
n/a = Not Available. Additional monitoring was not necessary at these locations to establish 24-hour noise levels at the project site.
SOURCE: TAHA, 2017.



[7] Federal Transit Administration, *Transit Noise and Vibration Impact Assessment*, May 2006.

4.2 EXISTING VIBRATION ENVIRONMENT

There are no stationary sources of vibration located near the project site. Heavy-duty trucks can generate ground-borne vibrations that vary depending on vehicle type and weight, and pavement conditions. Based on site visits, vibration levels from adjacent roadways are not typically perceptible at the project site. In the year 2025, the Honolulu Rail Transit Project (HART) rail line will be fully operational and could potentially generate vibration at nearby receptors. However, the nearest component of HART is located approximately 660 feet to the southwest of the proposed project. Vibration is a high localized event and typically dissipates within a few feet from the source. Therefore, vibration generated by HART would not be perceptible at the project site.

4.3 SENSITIVE RECEPTORS

Sensitive land uses are locations where people reside or where the presence of unwanted sound could adversely affect the use of the land. Residences, schools, hospitals, guest lodging, libraries, and some passive recreation areas would each be considered sensitive and may warrant unique measures for protection from intruding noise. Sensitive receptors near the project site are listed below in **Table 4-2** and shown in **Figure 4-1**.

TABLE 4-2: SENSITIVE RECEPTORS

Key to Figure 4-1	Sensitive Receptor	Distance (feet)	Location

SOURCE: TAHA, 2017.

The above sensitive receptors represent the nearest noise sensitive receptors with the potential to be impacted by the proposed project. Additional sensitive receptors are located further from the project site in the surrounding community within one-quarter mile of the project site and would be less affected by the proposed project than the above sensitive receptors.

In addition to the off-site sensitive receptors listed above, sensitive receptors would be located on the project site during construction activity. The project site would be developed over phases and newly constructed residences would potentially be located adjacent to ongoing construction activity. These residences would be sensitive to construction noise and vibration.

5.0 METHODLOGY AND SIGNIFICANCE CRITERIA

5.1 METHODOLOGY

The analysis considers construction and operational sources of noise and vibration. The noise level during the construction period at each receptor location was calculated by (1) making a distance adjustment to the construction source sound level and (2) logarithmically adding the adjusted construction noise source level to the ambient noise level. Operational noise levels were calculated based on information provided in the traffic study and stationary noise sources located on the project site (e.g., mechanical equipment). To assess future noise levels at the project site, both railway noise from HART and traffic noise were analyzed using the HUD Day/Night Noise Level Calculator. The model calculates the Day/Night Noise Level for roadways by taking into account average vehicle speed, distance to receptor, average daily trips, road gradient, average daily trips (ADT) by vehicle type, and the percentage of ADT that occurs between the hours of 10:00 p.m. to 7:00 a.m. Railway noise is calculated using average train speed, distance to receptor, average daily train operations, track type, use of whistles and horns, railway cars per train, and the percentage of average daily train operations that occur between the hours of 10:00 p.m. to 7:00 a.m. The analysis is split by scenario, 50 percent buildout in the year 2022 without and with the project and 100 percent buildout in the year 2028 without and with the project. The HART will be fully operational in the year 2025 and as such, railway noise has been taken into account only for assessment of year 2028. Noise assessment locations (NALs) were selected along each side of the project site to represent noise levels that would be experienced by sensitive receptors.

5.2 SIGNIFICANCE CRITERIA

According to the Council on Environmental Quality regulations (40 Code of Federal Regulations (CFR) §§ 1500-1508), the determination of a significant impact is a function of both context and intensity. Context means that the significance of an action must be analyzed in several contexts such as society as a whole (human, national), the affected region, the affected interests, and the locality. Both short- and long-term effects are relevant. Intensity refers to the severity of impact. To determine significance, the severity of the impact must be examined in terms of the type, quality and sensitivity of the resource involved; the location of the proposed project; the duration of the effect (short- or long-term) and other consideration of context. Adverse impacts will vary with the setting of the proposed action and the surrounding area. Specific construction and operational impact criteria are listed below.

Construction Noise Adverse Effect Criteria

The proposed project would result in an adverse construction noise effect if:

- Construction activities occur prior to 7:00 a.m. and after 6:00 p.m., Monday through Friday, or before 9:00 a.m. and after 6:00 p.m. on Saturdays, or at any time on Sundays;
- Noise levels exceed the Hawaii State Department of Health *Noise Reference Manual Oahu Edition* maximum noise level of 78 dBA without first obtaining a noise variance; and/or
- Noise levels exceed the maximum Hawaii Administrative Rules noise levels shown in **Table 3-1** without first obtaining a permit from the Director of the Department of Health.

Operational Noise Adverse Effect Criteria

The proposed project would result in an adverse operational noise effect if:

- Noise levels at proposed residential land uses exceed the HUD exterior noise standard 65 dBA L_{dn}. If this standard is exceeded, further study is required to demonstrate that interior noise levels would not exceed 45 dBA L_{dn};
- Mobile sources cause a 5-dBA or more noise increase along off-site roadway segments, which is considered a noticeable change in noise levels that would likely evoke a community reaction; and/or
- Stationary source noise levels exceed the maximum Hawaii Administrative Rules noise levels shown in **Table 3-1** without first obtaining a permit from the Director of the Department of Health.

Ground-Borne Vibration Adverse Effect Criteria

The proposed project would result in an adverse vibration effect if:

- Vibration levels exceed 0.3 inches per second at off-site engineered concrete and masonry buildings; and/or
- Vibration levels exceed 0.12 inches per second at historic structures.

6.0 ENVIRONMENTAL EFFECTS

6.1 CONSTRUCTION NOISE

Construction activity would result in temporary increases in ambient noise levels in the project area on an intermittent basis. Noise levels would fluctuate depending on the construction phase, equipment type and duration of use, distance between the noise source and receptor, and presence or absence of noise attenuation barriers. Typical noise levels from various types of equipment that may be used during construction are listed in **Table 6-1**. The table shows noise levels at distances of 50 and 100 feet from the construction noise source.

TABLE 6-1: MAXIMUM NOISE LEVELS OF COMMON CONSTRUCTION MACHINES

	Noise Level (dBA)	
Noise Source	**50 Feet /a/**	**100 Feet /a/**
Auger Drill Rig	77.4	71.3
Backhoe	73.6	67.6
Compressor (air)	73.7	67.7
Concrete Mixer Truck	74.8	68.8
Concrete Pump Truck	74.4	68.4
Crane	72.6	66.6
Dozer	77.7	71.7
Dump Truck	72.5	66.5
Excavator	76.7	70.7
Flat Bed Truck	70.3	64.3
Front End Loader	75.1	69.1
Gradall	79.4	73.4
Paver	74.2	68.2

Vibratory Pile Driver	93.8	87.8
Welder / Torch	70.0	64.0

/a/ Assumes a 6-dBA drop-off rate for noise generated by a "point source" and traveling over hard surfaces.
SOURCE: Federal Highway Administration, *Roadway Construction Noise Model, Version 1.1*, 2008.

Project-related construction noise may contribute to community noise levels. Instead of a quantitative construction noise threshold, HUD encourages the use of quieter construction equipment and methods in population centers. Construction activity would only occur from 7:00 a.m. to 6:00 p.m., Monday through Friday and 9:00 a.m. to 6:00 p.m. on Saturdays. Noise levels would depend on the construction activity, type of equipment, number of pieces of equipment operating, general condition, length of time each piece would operate per day, the presence or absence of noise-attenuating features such as walls or other intervening structures, and the location of construction noise sources relative to sensitive receptors. **Table 6-1** shows the maximum estimated noise levels that would be generated by the construction equipment at 50 feet during the various stages and the estimated duration of construction. Construction activity would be short-term and intermittent and located within a dense urban environment with many existing sources of noise. In addition, Noise Control Measures **N1** through **N8** would minimize potential adverse effects.

Construction Noise Control Measures

N1 The project applicant shall obtain a noise permit associated with exceeding a noise level of 78 dBA L_{eq} as discussed in the *Noise Reference Manual Oahu Edition*.

N2 The project applicant shall obtain a noise permit associated with exceeding the maximum permissible noise levels discussed in the Hawaii Administrative Rules.

N3 The construction contractor shall use specialty equipment with enclosed engines and/or high-performance mufflers.

N4 The construction contractor shall locate equipment and staging areas as far from noise-sensitive receivers as practicable.

N5 The construction contractor shall limit unnecessary idling of equipment.

N6 The construction contractor shall install temporary noise barriers to enclose stationary noise sources, such as compressors, generators, laydown and staging areas, and other noisy equipment.

N7 Prior to the commencement of construction activities, notification shall be provided to the on-site residential uses that discloses the construction schedule, including the various types of activities and equipment that would be occurring throughout the duration of the construction period.

N8 A "noise disturbance coordinator" shall be established. The noise disturbance coordinator shall be responsible for responding to any local complaints about construction noise. The noise disturbance coordinator shall determine the cause of the noise complaint (e.g., starting too early, bad muffler, etc.) and shall be required to implement reasonable measures such that the complaint is resolved. All notices that are posted at the construction site shall list the telephone number for the noise disturbance coordinator.

6.2 CONSTRUCTION VIBRATION

Construction activity can result in varying degrees of ground-borne vibration, depending on the equipment and methods employed. As shown in **Table 6-2**, use of heavy equipment (e.g., a large bulldozer or caisson drilling) typically generates vibration levels of 0.089 inches per second at a distance of 25 feet. Impact pile driving may be required for the proposed project which would generate a maximum vibration level of 1.518 inches per second or a typical vibration level of 0.644 inches per second.

TABLE 6-2: VIBRATION VELOCITIES FOR CONSTRUCTION EQUIPMENT

Equipment		**PPV at 25 feet (Inches/Second) /a/**
Pile Driver (impact)	Upper Range	1.518
	Typical	0.644
Caisson Drilling		0.089
Large Bulldozer		0.089
Loaded Trucks		0.076

/a/ Generally, historic buildings can be exposed to ground-borne vibration levels of 0.12 inches per second without experiencing structural damage.
SOURCE: Federal Transit Administration, *Transit Noise and Vibration Impact Assessment*, May 2006.

In extreme circumstances, equipment-related vibration can cause building damage. A number of buildings abut the project site, including Fuji Store and Tenement Houses, the Aldersgate United Methodist Church, the Agmata Building, Fujii Family Partnership. Liu Trading, and a Shell Gas Station. Site visits suggest that these buildings were constructed using engineered concrete and masonry. Federal guidance indicates that such buildings can withstand up to 0.3 inches per second without experiencing damage.[8] The use of construction equipment that would produce high levels of vibration, such as large bulldozers, jack hammers, and load trucks, could exceed this criterion if occurring within 11 feet of the buildings. However, the Fuji Store and Tenement Houses would be held to the vibration standard for historic resources, which is discussed below. Construction activity would only occur from 7:00 a.m. to 6:00 p.m., Monday through Friday and 9:00 a.m. to 6:00 p.m. on Saturdays. In addition, Vibration Control Measures **N9** through **N11** would minimize potential adverse effects associated with damage to adjacent buildings.

There are also several historic structures near the project site, including the Fuji Store and Tenement Houses adjacent to the project site along King Street, Palama Theater located approximately 200 feet to the west, Kaumakapili Church located approximately 420 feet to the northwest, and Tamashiro Market located approximately 690 feet to the northwest and O'ahu Railway and Land Company Depot – Honolulu Station located approximately 800 feet to the southwest. Federal guidance indicates that such buildings can withstand up to 0.12 inches per second without experiencing damage.[9] Vibration levels from construction equipment such as a large bulldozer would be 0.0039 at 200 feet and there is no potential for vibration to damage historic structures located at a distance of 22 feet or greater. However, the Fuji Store and Tenement Houses are adjacent to the project site and could experience vibrations levels above the 0.12 inches per second threshold. Vibration Control Measures **N9** through **N11** would minimize potential adverse effects associated with damage at the Fuji Store and Tenement Houses.

Construction Vibration Control Measures

N9 Prior to issuance of a grading/shoring permit, a qualified structural engineer shall survey the existing foundation and structural integrity of off-site buildings that will be located within 11 feet of large bulldozers and similar vibration-generating equipment and at the Fuji Store and Tenement Houses. The survey shall be submitted to the appropriate mitigation monitor. At the conclusion of vibration causing activities, the qualified structural engineer shall issue a follow-on letter describing damage, if any, to the adjacent buildings. The letter shall identify recommendations for any repair, and certify the completion of any repairs as necessary to confirm the integrity of the foundation and structure of the adjacent buildings.

N10 If the construction plans call for high-vibration construction activities being performed close to structures, the contractor may be required to use alternative procedures that produce lower vibration levels. Examples of high-vibration construction activities include the use of pavement breakers, vibratory compaction, and hoe rams next to sensitive buildings. Alternative procedures shall include the use of non-vibratory compaction in limited areas and concrete saws in place of jackhammers or pavement breakers for demolition.

[8]Federal Transit Administration, *Transit Noise and Vibration Impact Assessment*, May 2006.
[9]*Ibid*.

N11 If piles are required to support new structures, pile driving shall be prohibited in place of cast-in-drilled-hole (CIDH) piles or caissons.

6.3 OPERATIONAL NOISE

Land Use Compatibility

The surrounding neighborhood has a mix of residential and commercial uses, churches, community services. A detailed land use compatibility analysis was completed to assess noise level at new residential land uses along heavily traveled roadways.
Table 6-3 shows the monitored exterior noise levels and predicted interior noise levels. Monitored noise levels along Liliha Street and Pua Lane were less than the 65 dbA L_{dn} exterior standard. The monitored noise levels along Vineyard Boulevard and King Street were 67.8 dBA L_{dn} and 66.9 dBA L_{dn}, respectively. However, new construction typically provides at least 26 dBA exterior-to-interior noise reduction.[10] With this reduction, it is anticipated that interior noise levels at new residences would be less than the 45 dBA L_{dn} standard. In addition, the project is designed such that the majority of exterior useable space would be centrally located away from off-site sources of noise.

TABLE 6-3: RESIDENTIAL LAND USE COMPATIBILITY ANALYSIS

Roadway Segment	Exterior Noise Level (L_{dn} dBA)	Interior Noise Level (L_{dn} dBA) /a/
Vineyard Blvd.	**67.8**	41.8
Liliha St.	64.3	38.3
Pua Ln.	56.9	30.9
King St.	**66.9**	40.9

/a/ Typical single-pane windows (i.e., 7/16 inches) provide a minimum noise reduction of approximately 26 dBA with windows closed. Window noise reduction can be found in the HUD Noise Notebook, Chapter 4 Supplement, Sound Transmission Class Guidance.
SOURCE: TAHA, 2017; FTA, *Transit Noise and Vibration Impact Assessment Manual*, 2006; HUD, *The Noise Guidebook, Chapter 4 Supplement, Sound Transmission Class Guidance, Page A-25*, March 2009.

The project site is located approximately 2.6 miles from the end of runway 26R of the HNL. This location is within the 55 to 60 dBA L_{dn} noise contour of the HNL 2008 (Forecast) Five Year Noise Exposure Map (**Figure 6-1**). The FAA has published land use compatibility guidelines that can be used to assess potential noise impacts to new development projects.[11] The guidelines indicate that residential land uses exposed to aircraft-related noise levels of less than 65 dBA L_{dn} are compatible with the ambient noise environment. The current HNL noise contours indicate that project site is located in a compatible noise environment related to aircraft activities. In addition, as discussed in Section 4.0 Existing Setting, above, noise monitoring was completed at the project site. The noise monitoring accounted for noise generated by HNL activities in addition to other sources of noise such as roadway traffic. The estimated L_{dn} associated with all sources of existing noise was estimated to range from 56.9 dBA to 67.8 dBA. As shown in **Table 6-3**, above, it is estimated the interior noise levels at new residences would range from 36.3 to 41.8 dBA L_{dn}. This would be less than the 45 dBA L_{dn} standard recommended by HUD and residents would not be exposed to excessive 24-hour noise.

It is acknowledged that single-event noise would be audible at the project site depending on multiple variables, including time of day and type of plane. Single event noise levels represent the noise generated by a single aircraft overflight. Specifically, it is a measure the total noise

energy from an overflight at a specific location. When excessive, single event noise activities can cause speech interference, sleep disturbance, and other negative effects. For aircraft noise, single event noise levels are typically about 10 dB higher than the maximum (L_{max}) noise levels. The L_{max} represents the maximum instantaneous noise energy at a specific location. The highest L_{max} monitored at the project site was 87.6 dBA, which results in a single event noise level of approximately 97.6 dBA. During the noise monitoring process, single event noise was not noted as being excessive during day or night time periods. In addition, as previously discussed, it is anticipated that interior noise levels would be consistent with applicable HUD standards for new residential development.

The HART will be fully operational in the year 2025 and will operate approximately 660 feet to the southwest of the project site along Dillingham Boulevard and Kaahi Street. The FTA has stated that light rail transit projects have no potential to impact sensitive land uses and distances greater than 350 feet.[12] A detailed analysis was completed to confirm this finding at the project site. The analysis was based on FTA guidance and used information obtained from the Honolulu High-Capacity Transit Corridor Project Final Environmental Impact Statement, prepared in June 2010. The analysis indicated that HART-related noise levels would be 48.0 dBA L_{dn} at the project site, which would be well below the existing 24-hour noise levels shown in **Table 4-1**.

Project-Related Transportation Noise

Traffic will be the dominant noise source during project operation. The proposed project would generate approximately 5,065 net new vehicles trips at 50 percent buildout in 2022, with approximately 235 a.m. peak hour trips and 502 p.m. peak hour trips. At full buildout in 2028, the proposed project would generate approximately 10,085 net new vehicles trips, with approximately 578 a.m. peak hour trips and 959 p.m. peak hour trips. In addition to traffic noise, the HART will be fully operational in the year 2025 and will operate approximately 660 feet to the southwest of the project site along Dillingham Boulevard and Kaahi Street. Railway noise has been taken into account for assessment of future year 2028 operations. Noise levels during the project's 50 percent buildout in 2022 and 100 percent buildout in 2028 were calculated using HUD's Day/Night Noise Level calculator, which is explained in detail under Section 5.0 Methodology and Significance Criteria. A comparison between the future year without project and future year with project scenarios was conducted for both years 2022 and 2028. **Table 6-4** shows anticipated noise levels for the year 2022 and **Table 6-5** shows noise levels for the year 2028. **Figure 4-1**, above shows the four NALs.

TABLE 6-4: FUTURE 2022 NOISE LEVELS

	Estimated dBA, L_{dn}

9	62.9	63.0	0.1	No

SOURCE: TAHA, 2017.

The proposed project's maximum contribution to increasing noise levels in the year 2022 would occur at NAL 3, with an increase of 1.7 dBA L_{dn} above future without project noise levels. The maximum increase for the year 2028 would occur at NAL 2, with an increase of 1.4 dBA L_{dn} above future without project noise levels. The proposed project's contribution to mobile source noise levels would be would be less than 3 dBA for both years 2022 and 2028 and would not result in an adverse effect related to increasing noise levels at on-site or off-site sensitive receptors.

Stationary Noise

The primary stationary source of noise would be the operation of ventilation and air conditioning systems. The precise location of these systems is unknown at this time as detailed site plans have not been developed. Possible locations include street level and rooftops. Mechanical equipment such as ventilation and air conditioning systems typically generate noise levels of approximately 60 dBA L_{eq} at 50 feet without enclosures. Enclosures typically reduce noise levels by at least 10 dBA. Noise generated by mechanical equipment must meet the maximum permissible noise limits shown in **Table 3-1**. Modern developments typically include enclosed or fully shielded from view mechanical equipment. In addition, Noise Control Measure **N12** would ensure noise levels would be consistent with noise regulations.

Operational Noise Control Measures

N12 The project applicant shall require mechanical equipment (e.g., ventilation and air conditioning systems) to be enclosed such that noise levels do not exceed the maximum permissible noise levels listed in the Hawaii Administrative Rules.

6.4 OPERATIONAL VIBRATION

The proposed project would not include significant stationary sources of ground-borne vibration. Operational ground-borne vibration in the project vicinity would be generated by vehicular travel on the local roadways. However, similar to existing conditions, project-related traffic vibration levels would not be perceptible outside the roadway right-of-way. Therefore, the proposed project would not result in adverse effect related to the operational vibration.

7.0 CUMULATIVE EFFECTS

7.1 Federal

The National Environmental Policy Act (NEPA) requires that any agency proposing a major federal action, which may significantly affect the environment, consider the environmental impacts of the proposed action, any unavoidable adverse environmental impacts, and the relationship between local short term uses and long term productivity of the environment (42 United States Code 4332(c)). There are three types or categories of effect that must be considered during the NEPA process: direct, indirect, and cumulative (40 CFR 1508.25). A direct effect is one which is caused directly by our activities, at the same time, and in the same place. An indirect effect is a reasonably foreseeable effect caused by the proposed action or alternatives, but occurs later in time or are further removed from the project site than a direct effect. "Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate," and related effects on resources (40 CFR 1508.8(b)). A cumulative effect is an "impact on the environment which results from the incremental effect of the action when added to other past, present, and reasonably foreseeable future actions" (40 CFR 1508.7). Cumulative effects can result from individually minor but collectively significant actions taking place over time (40 CFR 1508.7).

A cumulative effects analysis is required whenever an Environmental Impact Statement is prepared in accordance with NEPA. A project must have a direct and/or indirect effect on a specific resource to exert a cumulative influence. If no direct and/or indirect effect to a specific resource is expected, there is no need to consider cumulative effects to that resource. As previously discussed, the proposed project would not result in an adverse noise or vibration effect. The HART project is located approximately 660 feet to the southwest. The HART project would be in its construction phase concurrently with construction of the proposed project. However, at a distance of 660 feet it is unlikely for the HART project to combine with the proposed project to produce a cumulative construction noise or vibration impact. HART operational noise levels were assessed as a part of the transportation noise analysis and were found to be not adverse when combined with the proposed project's operational noise levels. Therefore, a cumulative effect would not occur under NEPA regulations.

7.2 State

Section 11-200-2 of the Hawaii Administrative Rules contains the definition of a "cumulative impact" for Environmental Impact Statements. A "cumulative impact" is defined as the impact on the environment, which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

Noise and vibration generated by the proposed project would generally be contained to the project site and unlikely to interact with past, present, and reasonably foreseeable future actions in the immediate vicinity to increase noise and vibration. Project-related vehicle trips would combine with past, present, and reasonably foreseeable future actions to increase traffic noise on the roadway network. **Tables 6-4** and **6-5**, above, include noise levels associated with traffic growth unrelated to the proposed project in years 2022 and 2028. The analysis demonstrates that a cumulative increase in traffic volumes would not result in an adverse effect resulting from an off-site mobile noise level increase. Therefore, a cumulative effect would not occur under State regulations.

Jeanne Staley, Manager, Tucson Office, 9.10S

FROM: Robert J. De Monte, Regional Administrator-Regional Housing Commissioner, 9S

SUBJECT: Implementation of the HUD-EPA Memorandum of Understanding on Sole Source Aquifers

All housing actions and programs and all, non-exempt CDBG, Rental Rehabilitation, Emergency Shelter Grant and HDG activities and projects are subject, by regulation, to the Sole Source Aquifer (SSA) consultation procedures [Section 1424(e)] of the Safe Drinking Water Act (SDWA). In order to ensure that all HUD activity complies with the Act and to facilitate and expedite the required consultation procedures, the regional offices of HUD and EPA have executed the enclosed Memorandum of Understanding (MOU) limiting the types of activity that require consultation. Whereas this information has already been imparted to affected offices, this present memorandum has been prepared to facilitate implementation of the MOU.

There are presently only six (6) EPA-designated SSA's in the HUD Region IX area. Two are located in Arizona, including portions of Pima, Pinal, Santa Cruz, and Cochise counties and part of the Tohono O'Odham Reservation. Two are located in the California counties of Fresno and Santa Cruz. One is in Hawaii, entirely within Honolulu County. And one is located in the Territory of Guam.

We have identified the following CDBG grantees with SSA's in their geographic jurisdictions: the State of Arizona; the State of California; the City of Tucson; the County of Fresno; the Tohono O'odham Nation; the Pascua-Yaqui Tribe; the Cold Springs Tribe; the City and County of Honolulu, and the Territory of Guam. Please convey this information to all HUD staff and any other grantees whose environmental review functions are affected by this MOU.

In essence, the MOU states that HUD program staff and HUD grantees must, henceforth, refer to EPA for comment only those assisted projects which, in addition to being located in a SSA area, involve the following: 1) agricultural activities; 2) construction or land development projects whose sanitation facilities will consist of individual disposal systems, community sewer systems, or publicly owned sewer systems discharging on the aquifer; 3) the preparation of an EIS; 4) toxic chemicals or radioactive materials; 5) sanitary landfills; 6) water wells; or 7) facilities which dispose of waste water without employing treatment plants. Non-consultation with EPA on these program activities would constitute non-compliance with the Safe Drinking Water Act.

Section II of the MOU contains sufficient information to make, when permissible, the unilateral determination that a project will not contaminate a SSA through its streamflow, source, or recharge zones. In short, HUD staff may now determine, without further consultation, whether certain activities and projects (other than those mentioned above) can cause the contamination of EPA designated SSA's and thus whether they are in compliance with Section 1424(e) of the SDWA.

The MOU defines the EPA-designated SSA areas and further specifies the kind of information required to make decisions about those SSA contamination impacts which can create significant hazards to public health. Refer to the MOU itself for more specific details.

Feel free to call Environmental Specialist Ernest Molins at FTS 556-6642 if you have questions on this issue.

Enclosure

Memorandum of Understanding
Between
The Department of Housing and Urban Development
Region IX, San Francisco, CA, and
The Environmental Protection Agency, Region IX, San Francisco, CA

CHRON FILE

I. INTRODUCTION and PURPOSE

This Memorandum of Understanding (MOU) is a record of agreement between the Region IX Offices of the U.S. Environmental Protection Agency (EPA) and the Department of Housing and Urban Development (HUD) concerning EPA review of projects receiving Federal financial assistance and that may affect Region IX sole source aquifers designated pursuant to Section 1424(e) of the Safe Drinking Water Act (PL 93-523). This MOU outlines the steps that will be followed by HUD in determining which projects should be subject to review, and the procedures that will be followed by both agencies in meeting the requirements of Section 1424(e).

Pursuant to Section 1424(e), EPA has designated six (6) aquifers in Region IX (others may be added from time to time) which are the sole or principal source of drinking water for all municipal and private water systems in that watershed, and that if contaminated, would create a significant hazard to public health.

Therefore, per this MOU, no HUD (or HUD grant recipient) commitment for Federal financial assistance and/or Federal insurance may be entered into for any project which EPA pre-determines may contaminate the aquifer through its streamflow source and recharge zones so as to create a significant hazard to public health.

The purpose of this MOU is to ensure that each project proposed within an EPA designated sole source aquifer area (see attached maps) that is to receive HUD mortgage insurance or other financial assistance, is designed and constructed in a manner that will not cause contamination of any EPA designated sole source aquifer nor cause a public health hazard in connection with such designated sole source aquifers. In order to achieve this purpose, HUD or HUD Community Development Block Grant recipients (See Section III) will notify EPA of all applications for projects listed in II-A below at the earliest possible date. If an Environmental Impact Statement (EIS) pursuant to the National Environmental Policy Act (NEPA) is prepared for any project in the sole source aquifer area, HUD and EPA will coordinate so that the Draft EIS for the project contains EPA's 1424(e) comments.

II. PROJECT IDENTIFICATION

A. The following projects will be referred to EPA for review/comments under Section 1424(e):

Projects that are located within an EPA designated sole source aquifer area for which HUD mortgage insurance or other assistance is requested, and which involve:

1. Agricultural activities including but not limited to land related operations employed in the production, raising, processing and marketing of crops or livestock.

2. Construction of (or addition to) residential, commercial or industrial projects, or public facilities, or land developments, whose sanitation facilities will consist of individual disposal systems (cesspools, septic tanks with leach fields or seepage pits), or community sewerage systems (owned either privately or by a homeowners association), or a proposed (i.e. not yet in place) publicly owned piped sanitary sewer system, the discharge from which will terminate within the watershed of the aquifer.

3. The preparation of an EIS.

4. Existing or proposed industrial projects which manufacture, store, transport, or dispose of toxic chemicals or radioactive materials.

5. Acquisition of a site intended to be used for a sanitary landfill and its operation, or closure of a sanitary landfill.

6. Construction or abandonment of a water well.

7. Facilities which dispose of their waste water in either dry wells, retention ponds, or by other methods not employing a treatment plant.

B. The EPA and HUD mutually agree that activities listed below would not affect water quality in Region IX sole source aquifers, and need not be referred to EPA for evaluation prior to HUD approval:

1. Construction of (or addition to) residential, commercial or industrial projects, or public facilities, or land developments, which will be served by an existing and publicly owned and operated sewerage system and treatment plant which is not subject to a locally or EPA imposed moratorium, except for any development covered in A above.

2. Acquisition, disposition, rehabilitation, reconstruction or modernization of existing projects, buildings, and public facilities.

3. Financial assistance (loans or grants) including refinancing, or provision of mortgage insurance on existing projects, properties, buildings or developments.

4. Public services, preparation of environmental studies or project plans, planning activities, technical assistance and training, payment/repayment or reimbursement of loans or interest.

5. Emergency activities for mitigating an imminent threat to health and safety.

III. COMMUNITY DEVELOPMENT BLOCK GRANT APPLICATIONS

HUD regulations, at 24 CFR Part 58, implement the requirements of section 104(g) of the Housing and Community Development Act of 1974, as amended, and apply to activities and projects funded with HUD assistance, under all Community Development Block Grant (CDBG) and other grant programs. This includes entitlement grants, non-entitlement (i.e. small cities) grants administered by HUD or by States, and grants to Indian tribes.

Pursuant to section 104(g), a grant recipient's assumption of the responsibility for environmental review and decision making, includes such responsibilities under the other provisions of law and authorities specified at 58.5.

Before committing any CDBG or other grant funds (other than for activities exempt under 58.34), the recipient must certify that it has complied with the requirements and obligations which would apply to HUD under the other laws and authorities, including Section 1424(e) of the Safe drinking Water Act of 1974, as amended.

The following procedures shall apply to CDBG applications in addition to those specified in Section IV below:

A. HUD will inform all CDBG recipients, and States which administer the Small Cities Block Grant program, that a 1424(e) review will be required for all projects listed in II-A above.

B. If the recipient submits a Request for Release of Funds (RROF) and certification for a project listed in II-A above, and which EPA has determined will contaminate the sole source aquifer so as to create a hazard to public health and has so advised the recipient in writing, the EPA shall submit an objection to the RROF to HUD (or to the State in the case of a state administered Small Cities Block Grant program) within 15 days from the time EPA receives the Notice of Intent to RROF. In such cases, HUD (or the State) will not release the funds until the matter has been resolved between EPA and the recipient, and HUD (or the State) has been so advised in writing.

C. The environmental requirements for multi-year projects must encompass the entire multi-year scope of activities and be included in the RROF and certification.

IV. REVIEW PROCEDURE

A. Upon receipt of applications by HUD, or prior to submitting a RROF and certification to HUD (or to the State) by a recipient, for projects meeting the criteria in II-A above, the HUD office will send copies of the application, or the recipient will send a brief description of the proposed project (see 2 below), to EPA for its review.

1. EPA shall notify the HUD Office (or the recipient) in writing within 10 calendar days to request additional information it may need to conduct its review.

2. Information needed by EPA normally includes the following and may be submitted concurrently with Item IV-A above:

   (a) Location map identifying project location relative to the sole source aquifer area, and topographic map.

   (b) Description and objective of project activity, including project design, materials to be used, assessment of potential impacts on ground water quality and quantity, and alteration of natural topography and vegetation.

   (c) Names/addresses/telephone numbers of any City, County, State or Federal agencies that are involved.

3. EPA shall have 30 calendar days to review and submit its comments to the HUD Office, or to the recipient. The 30 day period will begin when EPA has received the additional data it may have requested.

4. EPA may request and HUD (or the recipient) may grant additional time for review and comment in exceptional cases. Requests and approvals shall be in writing.

5. HUD (or the recipient) may approve the project if no EPA approval has been received within the normal 30 days or longer agreed-to period.

6. EPA review recommendations shall be sent directly to the HUD Office, or to the recipient, as applicable.

7. When the project reviewed was submitted to EPA by a HUD Field Office, a copy of EPA comments shall also be submitted to:
   HUD Regional Environmental Officer
   San Francisco, CA 94102

B. Each Draft EIS prepared by HUD or by a recipient, for projects within a sole source aquifer area, shall reflect EPA comments.

C. Materials submitted to EPA by HUD or recipients under this Memorandum of Understanding will be addressed to the attention of the Office of Ground Water (W-1-G), EPA Region IX, San Francisco, CA 94105.

D. Local Area Certification (HUD Handbook 4135.1 Rev 2) - If all or part of the geographical boundaries of a certifiable or conditionally certifiable community are within a sole source aquifer area, and residential land developments will meet criteria II.A. 2 above, the HUD office may consult with EPA as part of the certification review process.

E. HUD and EPA will each assign liaison personnel to serve as contact points and to be responsible for maintaining communications as to procedures and activities of their respective agency in Federal Region IX. The liaison personnel are:

HUD: Regional Environmental Officer
San Francisco, CA 94102

EPA: Director, Office of Groundwater,
San Francisco, CA 94105

The liaison personnel, accompanied by appropriate staff, will hold meetings as needed to discuss matters of concern related to Region IX aquifers and this Memorandum of Understanding.

F. The Memorandum of Understanding is subject to revision upon agreement of both parties.

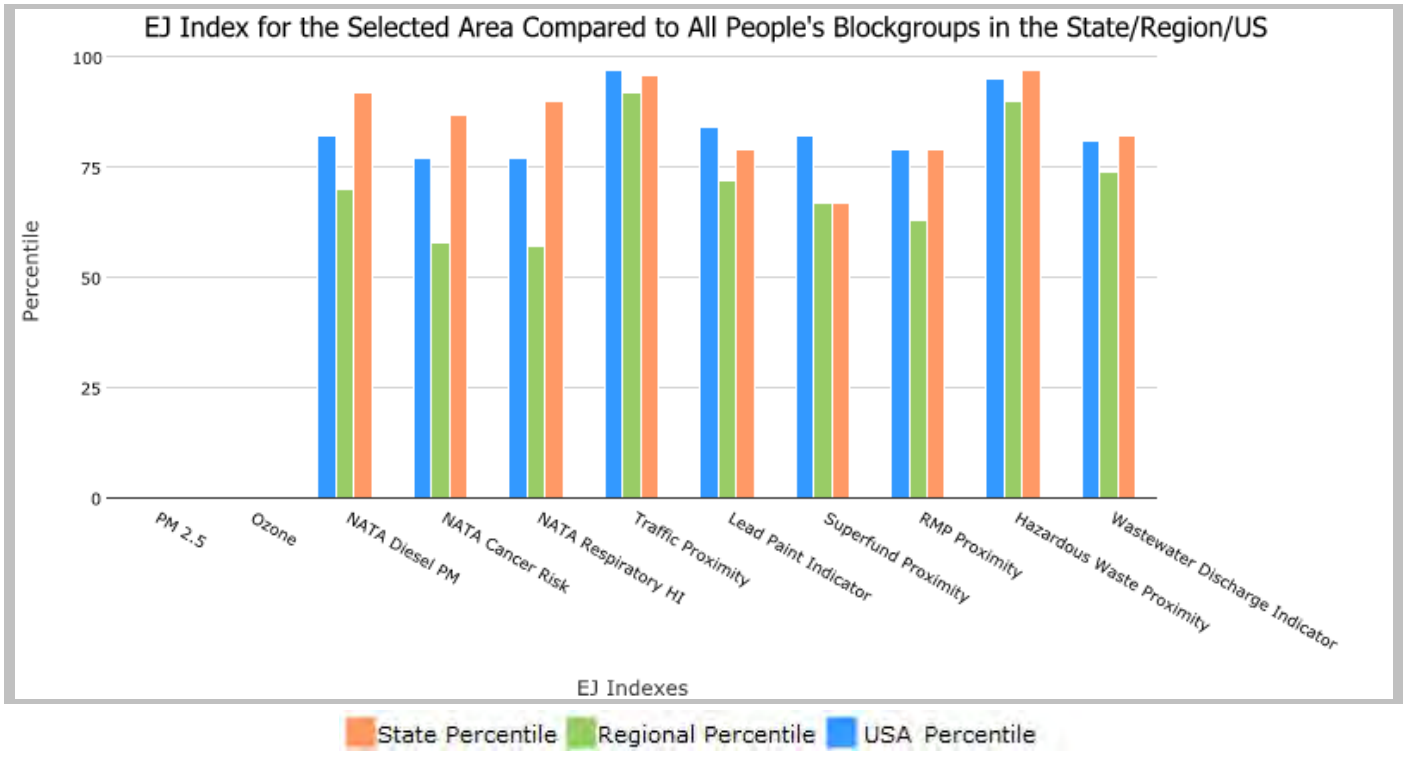
EJ Index for RMP Proximity	79	63	79
EJ Index for Hazardous Waste Proximity	97	90	95
EJ Index for Wastewater Discharge Indicator	82	74	81



This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

* The National-Scale Air Toxics Assessment (NATA) is EPA's ongoing, comprehensive evaluation of air toxics in the United States. EPA developed the NATA to prioritize air toxics, emission sources, and locations of interest for further study. It is important to remember that NATA provides broad estimates of health risks over geographic areas of the country, not definitive risks to specific individuals or locations. More information on the NATA analysis can be found at: https://www.epa.gov/national-air-toxics-assessment.

For additional information, see: www.epa.gov/environmentaljustice

EJSCREEN is a screening tool for pre-decisional use only. It can help identify areas that may warrant additional consideration, analysis, or outreach. It does not provide a basis for decision-making, but it may help identify potential areas of EJ concern. Users should keep in mind that screening tools are subject to substantial uncertainty in their demographic and environmental data, particularly when looking at small geographic areas. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports. This screening tool does not provide data on every environmental impact and demographic factor that may be relevant to a particular location. EJSCREEN outputs should be supplemented with additional information and local knowledge before taking any action to address potential EJ concerns.

1.0 SUMMARY OF FINDINGS

Terry A. Hayes Associates Inc. has completed an Air Quality Study for the proposed Mayor Wright Homes Redevelopment Project (proposed project). Key findings are listed below.

- Construction activity would result in temporary emissions from construction vehicle exhaust, as well as fugitive dust emissions due to ground disturbance. The proposed project would not result in an adverse effect related to construction air quality. However, the following control measures are recommended to reduce fugitive dust emissions.

  AQ1 The construction contractor shall use water or suitable chemicals to control fugitive dust in the demolition of any existing buildings or structures, construction operations, the grading of roads, or the clearing of land.

  AQ2 The construction contractor shall apply asphalt, water, or suitable chemicals on roads, material stockpiles, and other surfaces which may result in fugitive dust.

  AQ3 The construction contractor shall cover all moving, open-bodied trucks transporting materials which may result in fugitive dust.

  AQ4 The construction contractor shall maintain roadways in a clean manner.

  AQ5 The construction contractor shall promptly remove earth or other materials from paved streets which have been transported there by trucking, earth-moving equipment, erosion, or other means.

Air Quality Control Measures **AQ6** through **AQ9** are recommended to reduce pollutant exposure to residences residing on the project site during construction activities.

  AQ6 Staging areas shall be located away from on-site residential land uses.

  AQ7 On-site electricity shall be obtained from the electrical grid rather than temporary diesel or gasoline generators.

  AQ8 Equipment and vehicle engines shall be maintained in good condition and in proper tune per manufacturers' specifications.

  AQ9 All construction equipment and delivery vehicles shall be turned off when not in use or prohibit idling in excess of five minutes. Haul trucks in particular that stage waiting to be called to remove dirt from the site shall not be allowed to idle while queuing.

- Implementation of the proposed project would introduce approximately 10,085 new daily trips to the project area, including 578 trips during the AM peak hour and 959 trips during the PM peak hour. Implementation of the proposed project would result in a maximum increase of 14 percent at the most congested intersection of the project area in 2028 upon full buildout. A 14 percent incremental increase in intersection volumes would not have the potential to exceed any applicable ambient air quality standards. Therefore, the proposed project would not result in adverse effect related to regional operational emissions.

- The proposed project would result indirect greenhouse gas (GHG) emissions through electricity generation at an off-site facility, water distribution to the future structures, and on-road mobile sources associated with vehicle trips. As of April 5, 2017, the CEQ has

withdrawn its "Final Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in National Environmental Policy Act [(NEPA)] Reviews," for which a Notice of Availability was originally published on August 5, 2016. Therefore, no guidance currently exists for addressing GHG emissions and climate change under NEPA.

- The project would not interfere with the development of clean energy supplies and would not include a substantial on-site source of GHG emissions. The proposed project would locate in-fill development near existing public transportation and shopping areas, thereby reducing mobile source emissions compared to development located outside of urban areas. Energy conservation features and in-fill development benefits would ensure that the proposed project would not result in a significant GHG impact.

2.0 INTRODUCTION

2.1 PURPOSE

The purpose of this report is to evaluate the potential for adverse air quality effects of the proposed project. Air quality emissions are assessed for construction and operational activities. Air quality control measures are recommended when appropriate to reduce emissions.

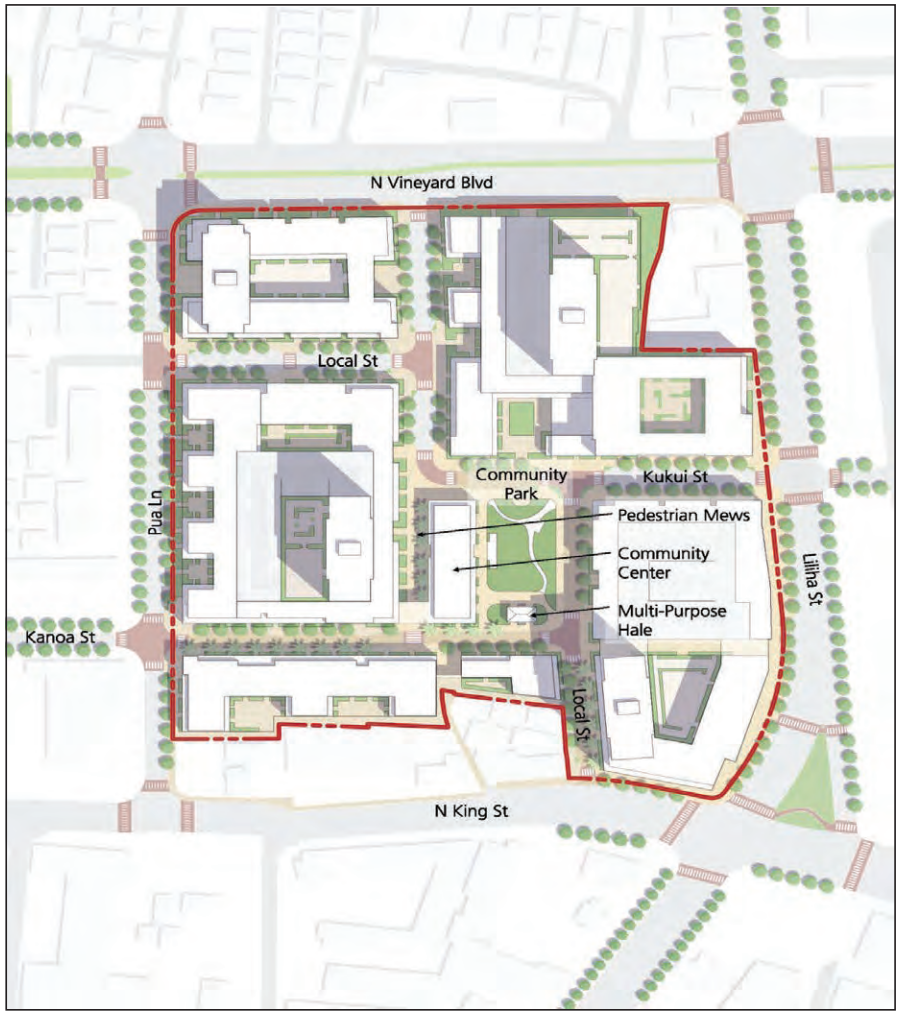
The analysis examines the degree to which the proposed project may cause significant adverse changes to air quality. Both short-term construction emissions occurring from activities such as site grading and haul truck trips, and long-term effects related to the ongoing operation are discussed in this section. This analysis focuses on air pollution from two perspectives: daily emissions and pollutant concentrations. “Emissions” refer to the quantity of pollutant released into the air, measured in pounds per day (ppd) or tons per year (tpy). “Concentrations” refer to the amount of pollutant material per volumetric unit of air, measured in parts per million (ppm) or micrograms per cubic meter (µg/m^3).

2.2 PROJECT DESCRIPTION

The proposed project would redevelop the existing Mayor Wright Housing on Liliha Street in Honolulu, Hawaii. The existing 15-acre project site includes 364 affordable housing units. The proposed mixed-use development includes up to 2,500 residential units and up to 80,000 square feet of retail and commercial uses. The proposed project would also incorporate a community park, pedestrian mews, a multi-purpose hall, and a community center.

The project site is located in the Kalihi community on the island of Oahu. The site is generally bounded by North King Street on the southwest, Vineyard Boulevard on the northeast, Pua Lane on the northwest, and Liliha Street on the southeast. The H-1 Freeway is located east of the site and would provide residents living in the future project with access to jobs in Kapolei, Pearl City, Aiea and Pearl Harbor, as well as areas Diamond Head of downtown Honolulu.

The location of the proposed project is shown in **Figure 2-1** and the site plan is shown in **Figure 2-2**.



3.0 TOPICAL BACKGROUND & REGULATORY FRAMEWORK

This section provides an overview of how ambient air quality is characterized and the applicable regulations that have been established to protect public health and the environment, as well as a discussion of greenhouse gas (GHG) emissions, how they contribute to climate change, and the regulatory framework developed to reduce GHG emissions. According to the Hawaii Department of Health, air pollution is a general term that refers to the presence in the outdoor air of substances in quantities and for durations which may endanger human health or welfare, plant or animal life, or property; or which may reasonably interfere with the comfortable enjoyment of life and property.

Through extensive scientific research, specific chemical substances have been identified as air pollutants that are known to cause adverse health effects and degradation of environmental quality. Concentrations of the following pollutants in ambient air are regulated at the federal and state level to protect public health and the environment. A separate discussion of GHG emissions and climate change is provided subsequently.

3.1 AIR POLLUTANTS

Ozone (O_3). O_3, or smog, is not emitted directly into the environment, but is formed in the atmosphere by complex chemical reactions between reactive organic gases (ROG) and nitrogen oxides (NO_X) in the presence of sunlight. Ozone formation is greatest on warm, windless, sunny days. The main sources of NO_X and ROG, often referred to as ozone precursors, are combustion processes (including motor vehicle engines) the evaporation of solvents, paints, and fuels, and biogenic sources.

Automobiles are the single largest source of ozone precursors. Tailpipe emissions of ROG are highest during cold starts, hard acceleration, stop-and-go conditions, and slow speeds. They decline as speeds increase up to about 50 mph, then increase again at high speeds and high engine loads. ROG emissions associated with evaporation of unburned fuel depend on vehicle and ambient temperature cycles. Nitrogen oxide emissions exhibit a different curve; emissions decrease as the vehicle approaches 30 mph and then begin to increase with increasing speeds.

Ozone levels usually build up during the day and peak in the afternoon hours. Short-term exposure can irritate the eyes and cause constriction of the airways. Besides causing shortness of breath, it can aggravate existing respiratory diseases such as asthma, bronchitis and emphysema. Chronic exposure to high ozone levels can permanently damage lung tissue. Ozone can also damage plants and trees, and materials such as rubber and fabrics.

Nitrogen Dioxide (NO_2). NO_2 is a reddish-brown gas that is a by-product of combustion processes. Automobiles and industrial operations are the main sources of NO_2. Aside from its contribution to ozone formation, nitrogen dioxide can increase the risk of acute and chronic respiratory disease and reduce visibility. NO_2 may be visible as a coloring component of a brown cloud on high pollution days, especially in conjunction with high ozone levels.

Carbon Monoxide (CO). CO is an odorless, colorless gas formed by the incomplete combustion of fuels. The single largest source of CO is motor vehicles. Emissions are highest during cold starts, hard acceleration, stop-and-go driving, and when a vehicle is moving at low speeds. New findings indicate that CO emissions per mile are lowest at about 45 miles per hour (mph) for the average light-duty motor vehicle and begin to increase again at higher speeds. When inhaled at high concentrations, CO combines with hemoglobin in the blood and reduces the oxygen carrying capacity of the blood. This results in reduced oxygen reaching the brain,

heart and other body tissues. This condition is especially critical for people with cardiovascular diseases, chronic lung disease or anemia, as well as fetuses. Even healthy people exposed to high CO concentrations can experience headaches, dizziness, fatigue, unconsciousness, and even death.

Sulfur Dioxide (SO_2). SO_2 is a colorless acid gas with a pungent odor. It has potential to damage materials and it can have health effects at high concentrations. It is produced by the combustion of sulfur-containing fuels, such as oil, coal and diesel. SO_2 can irritate lung tissue and increase the risk of acute and chronic respiratory disease.

Particulate Matter. Particulate matter refers to a wide range of solid or liquid particles in the atmosphere, including smoke, dust, aerosols, and metallic oxides. Respirable particulate matter with an aerodynamic diameter of 10 micrometers or less is referred to as PM_{10}. $PM_{2.5}$ includes a subgroup of finer particles that have an aerodynamic diameter of 2.5 micrometers or less. Some particulate matter, such as pollen, is naturally occurring. Most particulate matter is caused by combustion, factories, construction, grading, demolition, agricultural activities, and motor vehicles. Extended exposure to particulate matter can increase the risk of chronic respiratory disease. PM_{10} is of concern because it bypasses the body's natural filtration system more easily than larger particles, and can lodge deep in the lungs. The USEPA revised their PM standards to apply only to these fine particles. $PM_{2.5}$ poses an increased health risk because the particles can deposit deep in the lungs and contain substances that are particularly harmful to human health.

Lead (Pb). Pb is a metal found naturally in the environment as well as in manufactured products. The major sources of lead emissions have historically been mobile and industrial sources. As a result of the phase-out of leaded gasoline, metal processing is currently the primary source of lead emissions. The highest levels of lead in air are generally found near lead smelters. Other stationary sources are waste incinerators, utilities, and lead-acid battery manufacturers.

Twenty years ago, mobile sources were the main contributor to ambient lead concentrations in the air. In the early 1970s, the USEPA set national regulations to gradually reduce the lead content in gasoline. In 1975, unleaded gasoline was introduced for motor vehicles equipped with catalytic converters. The USEPA banned the use of leaded gasoline in highway vehicles in December 1995. As a result of the USEPA's regulatory efforts to remove lead from gasoline, emissions of lead from the transportation sector and levels of lead in the air decreased dramatically.

Toxic Air Contaminants (TACs). In addition to the criteria air pollutants listed above, another group of pollutants, commonly referred to as TACs or hazardous air pollutants can result in health effects that can be quite severe. Many TACs are confirmed or suspected carcinogens, or are known or suspected to cause birth defects or neurological damage. In addition, many TACs can be toxic at very low concentrations. For some chemicals, such as carcinogens, there are no thresholds below which exposure can be considered risk-free.

Industrial facilities and mobile sources are significant sources of TACs. The electronics industry, including semiconductor manufacturing, has the potential to contaminate both air and water due to the highly toxic chlorinated solvents commonly used in semiconductor production processes. Sources of TACs go beyond industry. Various common urban facilities also produce TAC emissions, such as gasoline stations (benzene), hospitals (ethylene oxide), and dry cleaners (perchloroethylene). Automobile exhaust also contains TACs such as benzene and 1,3-butadiene.

Odors and Dust. Other air quality issues of concern include nuisance impacts of odors and dust. Objectionable odors may be associated with a variety of pollutants. Common sources of odors include wastewater treatment plants, landfills, composting facilities, refineries and chemical plants. Similarly, nuisance dust may be generated by a variety of sources including quarries, agriculture, grading and construction. Odors rarely have direct health impacts, but they can be very unpleasant and can lead to anger and concern over possible health effects among the public.

3.2 AIR QUALITY REGULATORY FRAMEWORK

Federal Regulations

United States Environmental Protection Agency (USEPA). At the federal level, the USEPA has been charged with implementing national air quality programs. The USEPA's air quality mandates are drawn primarily from the Federal Clean Air Act (FCAA), which was enacted in 1963. The FCAA was amended in 1970, 1977, and most recently in 1990. The FCAA required the USEPA to establish primary and secondary National Ambient Air Quality Standards (NAAQS)—concentrations of pollutants not to be exceeded—shown below in **Table 3-1**. The NAAQS were devised to protect public health, reduce smog, and prevent degradation of environmental quality. Attainment of the NAAQS is achieved by demonstrating that measured concentrations of criteria pollutants for a region remained below the designated thresholds over a period of three years. The attainment status is shown in **Table 3-1**.

The FCAA also required each state to prepare an air quality control plan referred to as a State Implementation Plan (SIP). The Federal Clean Air Act Amendments of 1990 (FCAAA) added requirements for states with nonattainment areas to revise their SIPs to incorporate additional control measures to reduce air pollution. The SIP is periodically modified to reflect the latest emissions inventories, planning documents, and rules and regulations of the air basins as reported by their jurisdictional agencies. USEPA has responsibility to review all state SIPs to determine conformation to the mandates of the FCAAA and determine if implementation will achieve air quality goals. If the USEPA determines a SIP to be inadequate, a Federal Implementation Plan (FIP) may be prepared for the nonattainment area that imposes additional control measures. Failure to submit an approvable SIP or to implement the plan within the mandated timeframe may result in sanctions being applied to transportation funding and stationary air pollution sources in the air basin.

Federal Hazardous Air Pollutant Program. Title III of the FCAAA requires the USEPA to promulgate National Emissions Standards for Hazardous Air Pollutants (NESHAPs). The emissions standards were promulgated in two phases. In the first phase, the USEPA developed technology-based emission standards designed to produce maximum emission reductions. These standards are generally referred to as requiring Maximum Achievable Control Technology (MACT). In the second phase, the USEPA set health risk–based emissions standards to address risks remaining after implementation of the technology-based NESHAP standards. The FCAAA required the USEPA to promulgate vehicle or fuel standards containing reasonable requirements that control toxic emissions, at a minimum to benzene and formaldehyde. Performance criteria were established to limit mobile-source emissions of toxics, including benzene, formaldehyde, and 1,3-butadiene.

Mobile Source Air Toxics (MSAT). The USEPA issued a Final Rule on Controlling Emissions of Hazardous Air Pollutants from Mobile Sources on March 29, 2001. USEPA examined the impacts of existing and newly promulgated mobile source control programs, including: reformulated gasoline; national low emission vehicle standards; Tier 2 motor vehicle emissions

standards and gasoline sulfur control requirements; proposed heavy duty engine and vehicle standards; and on-highway diesel fuel sulfur control requirements. The Federal Highway Administration Projects that even with a substantial increase in vehicle miles traveled between 2000 and 2020 that these programs will reduce on-highway emissions of benzene, formaldehyde, 1,3-butadiene, and acetaldehyde by 57 to 65 percent, and will reduce on-highway diesel particulate matter emissions by 87 percent. As a result, USEPA concluded that no further motor vehicle emissions standards or fuel standards were necessary to further control MSATs.

State Regulations

State of Hawaii Department of Health. The State of Hawaii Department of Health Clean Air Branch is responsible for air pollution control in the State. The primary services of the branch are provided by its three sections: Engineering, Monitoring, and Enforcement. These sections conduct engineering analysis and permitting, perform monitoring and investigations, and enforce the federal and State air pollution control laws and regulations. The Department of Health Administrative Rules includes two chapters representing the Clean Air Branch. Chapter 59 identifies State ambient air quality standards (**Table 3-1**), and Chapter 60 discusses air pollution control methodology. Chapter 60 includes air permitting, sampling, modeling, and fugitive dust and motor vehicle provisions.

Chapter 60 §11-60.1-33 includes the following fugitive dust prohibitions:

- No person shall cause or permit visible fugitive dust to become airborne without taking reasonable precautions. Examples of reasonable precautions are:
  - Use of water or suitable chemicals for control of fugitive dust in the demolition of any buildings or structures, construction operations, the grading of roads, or the clearing of land;
  - Application of asphalt, water, or suitable chemicals on roads, material stockpiles, and other surfaces which may result in fugitive dust;
  - Installation and use of hoods, fans, and fabric filters to enclose and vent the handling of dusty materials. Reasonable containment methods shall be employed during sandblasting or other similar operations;
  - Covering all moving, open-bodied trucks transporting materials which may result in fugitive dust;
  - Conducting agricultural operations, such as tilling of land and the application of fertilizers, in such manner as to reasonably minimize fugitive dust;
  - Maintenance of roadways in a clean manner; and
  - Prompt removal of earth or other materials from paved streets which have been transported there by trucking, earth-moving equipment, erosion, or other means.

- Except for persons engaged in agricultural operations or persons who can demonstrate to the director that the best practical operation or treatment is being implemented, no person shall cause or permit the discharge of visible fugitive dust beyond the property lot line on which the fugitive dust originates.

In regards to motor vehicles, Chapter 60 §11-60.1-34 includes the following:

- No person shall operate a gasoline-powered motor vehicle which emits visible smoke while upon streets, roads, or highways.

TABLE 3-1: STATE AND NATIONAL AMBIENT AIR QUALITY STANDARDS AND ATTAINMENT STATUS

Pollutant	Averaging Period	Hawaii		Federal	
		Standard	Attainment Status	Standard	Attainment Status
Ozone (O_3)	1-hour Average	--	Attainment	--	--
	8-hour Average	0.08 ppm	Attainment	0.070 ppm (137 µg/m^3)	Attainment
Respirable Particulate Matter (PM_{10})	24-hour Average	150 µg/m^3	Attainment	150 µg/m^3	Attainment
	Annual Arithmetic Mean	50 µg/m^3	Attainment	--	--
Fine Particulate Matter ($PM_{2.5}$)	24-hour Average	--	--	35 µg/m^3	Attainment
	Annual Arithmetic Mean	--	--	15 µg/m^3	Attainment
Carbon Monoxide (CO)	8-hour Average	4.4 ppm	Attainment	9 ppm (10 mg/m^3)	Attainment
	1-hour Average	9 ppm	Attainment	35 ppm (40 mg/m^3)	Attainment
Nitrogen Dioxide (NO_2)	Annual Arithmetic Mean	0.04 ppm	Attainment	53 ppb (100 µg/m^3)	Attainment
	1-hour Average	--	Attainment	100 ppb (188 µg/m^3)	Unclassified
Sulfur Dioxide (SO_2)	24-hour Average	0.14 ppm	Attainment	--	--
	3-hour Average	0.5 ppm	--	0.5 ppm (1,300 µg/m^3)	--
	1-hour Average	--	--	75 ppb (196 µg/m^3)	Attainment
	Annual Arithmetic Mean	0.03 ppm	Attainment	--	--
Lead (Pb)	30-day average	1.5 µg/m^3	Attainment	--	--
	Calendar Quarter	1.5 µg/m^3	--	1.5 µg/m^3	Attainment
	Rolling 3-Month Average	--	--	0.15 µg/m^3	--
Hydrogen Sulfide (H_2S)	1-hour Average	0.025 ppm	Attainment	--	--

SOURCE: State of Hawaii Department of Health, *State of Hawaii Annual Summary 2015 Air Quality Data*, December 2016.

- No person shall operate a diesel-powered motor vehicle which emits visible smoke for a period of more than five consecutive seconds while upon streets, roads, or highways.

- No person shall cause, suffer, or allow any engine to be in operation while the motor vehicle is stationary at a loading zone, parking or servicing area, route terminal, or other off street areas, except:

  - During adjustment or repair of the engine at a garage or similar place of repair;
  - During operation of ready-mix trucks, cranes, hoists, and certain bulk carriers, or other auxiliary equipment built onto the vehicle or equipment that require power take-off from

the engine, provided that there is no visible discharge of smoke and the equipment is being used and operated for the purposes as originally designed and intended. This exception shall not apply to operations of air conditioning equipment or systems;
- During the loading or unloading of passengers, not to exceed three minutes; and
- During the buildup of pressure at the startup and cooling down at the closing down of the engine for a period of not more than three minutes.

- No person shall remove, dismantle, fail to maintain, or otherwise cause to be inoperative any equipment or feature constituting an operational element of the air pollution control system or mechanism of a motor vehicle as required by the provisions of the Act except as permitted or authorized by law.

3.3 GREENHOUSE GAS EMISSIONS AND CLIMATE CHANGE

Cumulative GHG emissions are believed to contribute to an increased greenhouse effect and global climate change, which may result in sea level rise, changes in precipitation, habitat, temperature, wildfires, air pollution levels and changes in the frequency and intensity of weather-related-events. While criteria pollutants and toxic air contaminants are pollutants of regional and local concern, GHG are global pollutants. The primary land-use related GHG are carbon dioxide (CO_2), methane (CH_4) and nitrous oxides (N_2O). The individual pollutant's ability to retain infrared radiation represents its "global warming potential" and is expressed in terms of CO_2 equivalents; therefore, CO_2 is the benchmark having a global warming potential of 1. Methane has a global warming potential of 28 and thus has a 28 times greater global warming effect per metric ton of CH_4 than CO_2. Nitrous Oxide has a global warming potential of 265. GHG emissions are generally expressed in units of annual metric tons of CO_2 equivalents (i.e., $MTCO_2e$/year).

3.4 CLIMATE CHANGE REGULATORY FRAMEWORK

International Regulations

A new international climate change agreement was adopted at the Paris United Nations Framework Convention on Climate Change conference in December 2015. The last two climate conferences in Warsaw (2013) and Lima (2014) decided that countries were to submit their proposed emissions reduction targets for the 2015 conference as "intended nationally determined contributions" prior to the Paris conference. The European Union has committed to an economy-wide, domestic GHG reduction target of 40 percent below 1990 levels by 2030. These targets are set with the goal of limiting global temperature rise to well below 2 degrees Celsius and getting to the 80 percent emission reduction by 2050.

Federal Regulations

The United States Supreme Court ruled in *Massachusetts v. Environmental Protection Agency, 127 S.Ct. 1438*, that CO_2 and other GHGs are pollutants under the CAA, which the USEPA must regulate if it determines they pose an endangerment to public health or welfare. On December 7, 2009, the USEPA made two distinct findings: 1) that the current and projected concentrations of the six key GHGs (CO_2, CH_4, N_2O, hydrofluorocarbons, perfluorocarbons and sulfur hexafluoride) in the atmosphere threaten the public health and welfare of current and future generations; and 2) that the combined emissions of these GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution which threatens public health and welfare.

On June 23, 2014, the U.S. Supreme Court ruled in *Utility Air Regulatory Group. v. EPA* that the USEPA exceeded its statutory authority under the CAA when it determined that stationary source emissions of GHGs would trigger permitting obligations under the Prevention of Significant Deterioration (PSD) program and Title V of the CAA. The Court, however, upheld those portions of USEPA's rulemaking that require a source to apply best available control technology (BACT) to GHG emissions where the source would otherwise trigger PSD permitting on account of its emissions of other pollutants. The Supreme Court's decision was limited to USEPA's regulation of GHG emissions under the PSD and Title V provisions of the CAA, and it left unanswered other questions regarding USEPA's permitting and BACT authority under the PSD program, and the USEPA's efforts to regulate GHG emissions from stationary sources.

State Regulations

In 2007, Hawaii became the second State in the nation to set a binding cap on GHG emissions through Act 234, which declared a policy to reduce GHG emissions statewide to 1990 levels by the year 2020. Act 234 served as the foundation for the Hawaii Greenhouse Gas Program, which was established by the Hawaii Department of Health (DOH) to combat the threat of climate change and sea level rise. This Program utilizes the Air Pollution Control Permit process of DOH's Clean Air Branch to regulate GHG emissions statewide, in conjunction with other federal and Hawaii State programs to mitigate GHGs. Parts of Act 234 are codified in Chapter 342B (Air Pollution Control) of the Hawaii Revised Statutes.

State Senate Bill (SB) 559, which was signed into law on June 8, 2017, expands strategies and mechanisms to reduce GHG emissions in alignment with the principles and goals adopted in the Paris Agreement, discussed above. SB 559 documents the State's commitment to combat climate change by systematically reducing GHG emissions and improving resiliency to climate change aligned with the principles and goals set by the Paris Agreement. It expands on strategies and mechanisms to reduce GHG emissions through the reduction of energy use, adoption of renewable energy, and control of air pollution among all agencies, departments, industries, and sectors, including transportation. SB 559 states that, "Such strategies and mechanisms shall utilize the best available science, technologies, and policies to reduce GHG emissions and shall be closely aligned with the climate change principles and goals adopted in the Paris Agreement and Hawaii's share of obligations within the expectations apportioned to the United States in the Paris Agreement, regardless of federal action. In addition, "The State shall strive to formulate and communicate long-term low greenhouse gas emission development strategies and shall take actions to conserve and enhance long-term sinks and reservoirs of greenhouse gases, by prioritizing the development of parks, greenways, and restoration of native upland and coastal forests and wetlands."

4.0 EXISTING ENVIRONMENTAL SETTING

4.1 AIR POLLUTION CLIMATOLOGY

Air quality in the vicinity of the proposed project is generally considered to be good due to the presence of northeasterly trade winds that tend to disperse pollutants seaward. As shown in **Table 3-1**, the project area is currently designated as being in attainment of all applicable ambient air quality standards. Air pollutant emissions from nearby stationary sources such as the Aloha Petroleum refinery, the Chevron Honolulu refinery, and the Honolulu Harbor are blown offshore in the opposite direction of the proposed project and do not pose environmental concerns with regards to degradation of air quality.

4.2 LOCAL CLIMATE

The annual average temperature in the project area is 75.3 degrees Fahrenheit (ºF). The project area experiences an average winter temperature of approximately 72.6ºF and an average summer temperature of approximately 77.7ºF. Annual average wind speed in the project area is approximately 11.5 miles per hour. Total precipitation in the project area averages approximately 26.4 inches annually. Precipitation averages approximately 11.0 inches during the winter, approximately 6.8 inches during the spring, approximately 6.3 inches during the fall, and 2.3 inches during the summer.[1]

4.3 AIR MONITORING DATA

The Island of Oahu has four active air monitoring stations, with the nearest air monitoring station to the project area being in Honolulu at 1250 Punchbowl Street on the top of the Department of Health building, which is located approximately one mile south-southeast of the proposed project. The Honolulu monitoring station measures concentrations of CO, SO_2, PM_{10}, and $PM_{2.5}$. The most recent period of air monitoring data available is from 2013–2015, which was published in the *State of Hawaii Annual Summary 2015 Air Quality Data* report.[2] During the period from 2013 to 2015, the Honolulu monitoring station did not record any violations of the NAAQS for CO, SO_2, PM_{10}, or $PM_{2.5}$ over any averaging period, as shown in **Table 3-2** below. The results of the monitoring period reflect consistency with the attainment designations presented in **Table 3-1** and the general perception that regional air quality in the vicinity of Honolulu is healthy.

TABLE 3-2: HONOLULU AIR MONITORING DATA SUMMARY

Pollutant	Standard	Maximum 2013	Maximum 2014	Maximum 2015
CO	9.0 ppm (1-hour)	1.6 ppm	2.0 ppm	1.4 ppm
	4.4 ppm (8-hour)	1.2 ppm	1.0 ppm	1.0 ppm
SO_2	0.075 ppm (1-hour)	0.022 ppm	0.018 ppm	0.010 ppm
	0.500 ppm (3-hour)	0.017 ppm	0.015 ppm	0.007 ppm
	0.140 ppm (24-hour)	0.005 ppm	0.008 ppm	0.003 ppm
PM_{10}	150 µg/m^3 (24-hour)	35 µg/m^3	30µg/m^3	36 µg/m^3
	50 µg/m^3 (Annual)	11µg/m^3	13µg/m^3	12 µg/m^3
$PM_{2.5}$	35 µg/m^3 (24-hour)	18 µg/m^3	12µg/m^3	17 µg/m^3
	15 µg/m^3 (Annual)	5.3 µg/m^3	4.4 µg/m^3	3.7 µg/m^3

4.4 SENSITIVE RECEPTORS

Sensitive land uses are locations where people reside or where the presence of substantial air pollutant concentrations could adversely affect the use of the land. Residences, schools, hospitals, guest lodging, libraries, and some passive recreation areas would each be considered sensitive and may warrant unique measures for protection from pollutant emissions. Sensitive receptors near the project site include the following:

- Residences located approximately 50 feet to the north across Pua Lane;
- Residences located approximately 130 feet to the northeast across Vineyard Boulevard;
- Residences located approximately 180 feet to the south across Liliha Street;
- Princess Victoria Ka'iulani Elementary School located approximately 240 feet to the west across King Street; and
- Kauluwela Elementary School located approximately 780 feet to the southeast across Vineyard Boulevard.

The above sensitive receptors represent the nearest receptors sensitive to detriment of local air quality with the potential to be impacted by the proposed project. Additional sensitive receptors are located further from the project site in the surrounding community within one-quarter mile of the project site and would be less affected by the proposed project than the above sensitive receptors.

In addition to the off-site sensitive receptors listed above, sensitive receptors would be located on the project site during construction activity. The project site would be developed over phases and newly constructed residences would potentially be located adjacent to ongoing construction activity. These residences would be sensitive to emissions of air pollutants generated by construction activities.

5.0 SIGNIFICANCE CRITERIA

According to the Council on Environmental Quality (CEQA) Regulations (40 Code of Federal Regulations (CFR) §§ 1500-1508), the determination of a significant impact is a function of both context and intensity. Context means that the significance of an action must be analyzed in several contexts such as society as a whole (human, national), the affected region, the affected interests, and the locality. Both short- and long-term effects are relevant. Intensity refers to the severity of impact. To determine significance, the severity of the impact must be examined in terms of the type, quality and sensitivity of the resource involved; the location of the proposed project; the duration of the effect (short- or long-term) and other consideration of context. Adverse effects will vary with the setting of the proposed action and the surrounding area.

6.0 ENVIRONMENTAL EFFECTS

6.1 CONSTRUCTION AIR POLLUTANT EMISSIONS

Prior to construction of the proposed project, existing structures on the project site would be demolished and the associated materials would be removed. It is possible that the existing structures on the project site may contain asbestos, and all demolition projects within the State of Hawaii must notify the Department of Health (DO) prior to commencement of activities. Accordingly, demolition activities associated with the proposed project would be subject to the requirements of Title 11 Hawaii Administrative Rules (HAR), DOH, Chapter 501, "Asbestos Requirements." The proposed project would complete an Asbestos Renovation/Demolition Survey to determine the potential for the presence of asbestos-containing materials (ACM). Additionally, all demolition and construction activities would adhere to the provisions of the Hawaii DOH Construction & Demolition (C&D) Waste Disposal General Guidance to ensure proper handling of potentially contaminated materials.

Construction activity would generate emissions through the use of heavy-duty construction equipment and through vehicle trips generated by construction workers traveling to and from the project site. Fugitive dust emissions would primarily result from site preparation (e.g., grading) activities. Nitrogen oxide emissions would primarily result from the use of construction equipment. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation and, for dust, the prevailing weather conditions.

Construction activity would occur over the entire 15-acre project site. A project site of this size would typically require an equipment inventory including a maximum of two scrapers and two graders to level the surface. This equipment inventory would potentially disturb up to three acres of the project site on a given day. Using USEPA AP-42 emission factors, it was determined that construction activity would generate up to 10 pounds per day of fugitive dust emissions. Construction emissions would be temporary and are not considered adverse. It is recommended that Air Quality Control Measures **AQ1** through **AQ5** be implemented to ensure accordance with Hawaii Administrative Rules. Air Quality Control Measures **AQ6** through **AQ9** are recommended to reduce pollutant exposure to residences residing on the project site during construction activities.

Construction Air Quality Control Measures

AQ1 The construction contractor shall use water or suitable chemicals to control fugitive dust in the demolition of any existing buildings or structures, construction operations, the grading of roads, or the clearing of land.

AQ2 The construction contractor shall apply asphalt, water, or suitable chemicals on roads, material stockpiles, and other surfaces which may result in fugitive dust.

AQ3 The construction contractor shall cover all moving, open-bodied trucks transporting materials which may result in fugitive dust.

AQ4 The construction contractor shall maintain roadways in a clean manner.

AQ5 The construction contractor shall promptly remove earth or other materials from paved streets which have been transported there by trucking, earth-moving equipment, erosion, or other means.

AQ6 Staging areas shall be located away from on-site residential land uses.

AQ7 On-site electricity shall be obtained from the electrical grid rather than temporary diesel or gasoline generators.

AQ8 Equipment and vehicle engines shall be maintained in good condition and in proper tune per manufacturers' specifications.

AQ9 All construction equipment and delivery vehicles shall be turned off when not in use or prohibit idling in excess of five minutes. Haul trucks in particular that stage waiting to be called to remove dirt from the site shall not be allowed to idle while queuing.

6.2 OPERATIONAL AIR POLLUTANT EMISSIONS

Clean Air Act Requirements

Conformity is a requirement of the CAA (Section 176(c), at 42 United States Code (U.S.C.) 7506(c)), to ensure that federal actions are consistent with the SIP to achieve and maintain NAAQS. Conformity only applies in areas that are designated nonattainment or maintenance for criteria pollutants. The proposed project is located in an Attainment/Unclassified area for all NAAQS. Therefore, conformity requirements do not apply.

The proposed project does not include a source of direct pollutant emissions. Indirect source of emissions include off-site electrical generation activities (if the energy source is non-renewable) and tailpipe emissions from on-road vehicles. As explained above, there is no nexus for estimating operational emissions. In addition, absent of the General Conformity Assessment, there are no significance criteria to be used for assessing adverse effects. The proposed project would not result in an adverse effect related to operational emissions.

The USEPA has published guidance on prevention of CO "hot spots" at congested intersections resulting from idling and slow-moving vehicles. The guidance focuses on the avoidance of localized spikes in CO concentrations causing violations of the ambient air quality standards. According to the Transportation Assessment prepared for the proposed project, full buildout would introduce approximately 10,085 net new daily vehicle trips to the project area, including 578 trips during the AM peak hour and 959 trips during the PM peak hour. The Transportation Assessment for the proposed project determined that the maximum peak hour intersection volume in 2028 following full buildout would be approximately 5,069 vehicles at the intersection of North King Street, Dillingham Boulevard, and Liliha Street.[3]

In response to the guidance promulgated by the USEPA, numerous regulatory agencies throughout the country undertook research to determine the types of intersections that may pose air quality concerns with regards to CO hot spots. Since the island of Oahu has always been in attainment of the ambient air quality standards, local regulatory agencies did not have a need to conduct research to satisfy the SIP requirements. However, mobile source emissions of CO are of particular concern in California, where the South Coast Air Quality Management (SCAQMD) engaged in extensive research to demonstrate how the CO NAAQS could be attained for the region.

Research published in 2003 by the SCAQMD involved air dispersion modeling of mobile CO emissions at some of the busiest intersections in southern California. Results of the CO dispersion modeling exercise determined that an intersection experiencing a peak hour volume of approximately 10,000 vehicles per hour—about twice the maximum within the project area—

[3]Fehr & Peers, *Transportation Assessment for Redevelopment of Mayor Wright*, May 2017.

would generate a maximum 1-hour CO concentration of approximately 4.6 ppm.[4] The applicable State 1-hour average CO ambient air quality standard is 9.0 ppm. Therefore, the maximum intersection volume in the project area following full buildout of the proposed project is approximately 25 percent of the volume that could potentially exceed the State 1-hour standard for CO.

Additionally, the maximum background 1-hour CO concentration measured in the vicinity of the project area was 1.4 ppm in 2015, which is approximately one-sixth of the applicable State 1-hour standard for CO. According to the Transportation Assessment, the maximum existing peak hour intersection volume in the project area is 4,439 at the intersection of North King Street, Dillingham Boulevard, and Liliha Street. Under the 2028 full buildout conditions, peak hour volumes at this intersection would be 5,039 vehicles, which represent an increase of approximately 14 percent relative to existing conditions. This incremental increase in maximum peak hour traffic volumes would not have the potential to increase maximum 1-hour CO concentrations in the project area by six times current levels. Therefore, implementation of the proposed project would not result in potential CO hot spots within the project area.

Residential Exposure

The proposed project would introduce new residential receptors to the project area that could potentially be adversely affected by existing sources of air pollution. For instance, the H1 Freeway is located approximately 1,000 feet northeast of the project site. According to the most recently available data obtained by the State in 2012, annual average daily traffic on the segment of the H1 Freeway in closest proximity to the project site was approximately 174,000 vehicles. Research conducted in the State of California determined that air pollution near freeways decreased by approximately 70 percent at a distance of 500 feet from the source, prompting the California Air Resource Board (CARB) to publish a recommended screening distance of 500 feet for siting new residences in proximity to freeways without mitigation.[5] The proposed project would be located at a distance from the H1 freeway equal to twice the California recommended screening threshold. Additionally, according to research published by the SCAQMD, air pollution generated by mobile sources on the H1 freeway would diminish by more than 80 percent before reaching the proposed project.[6] Therefore, long-term habitation of future residences on the project site would not have the potential to expose occupants to unacceptable levels of air pollution and no adverse effects would occur.

The project site is located approximately 2.6 miles from the end of runway 26R of the HNL. Air quality in the vicinity of the proposed project is generally considered to be good due to the presence of northeasterly trade winds that tend to disperse pollutants seaward. Air pollutant emissions from HNL are typically blown offshore in the opposite direction of the proposed project and do not pose a significant exposure concern. As shown in **Table 3-1**, the project area is currently designated as being in attainment of all applicable ambient air quality standards. Monitored data shown in **Table 3-2** demonstrates that pollutant concentrations are well below pollutant standards. The monitoring station at 1250 Punchbowl Street is less than one mile from the project site and can be used as indicator of a potential adverse effect from HNL, which has been demonstrated to be low.

GHG Emissions

As of April 5, 2017, the CEQ has withdrawn its "Final Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in National Environmental Policy Act [(NEPA)] Reviews," for which a Notice of Availability was originally published on August 5, 2016. Therefore, no guidance currently exists for addressing GHG emissions and climate change under NEPA. The USEPA has not issued explicit guidance or methods to conduct project-level GHG emissions analysis. Similar to criteria pollutant emissions, the proposed project does not include a source of direct pollutant emissions.

The State, through Act 234 and SB 559, has acknowledged that GHG emissions are a statewide impact. The project would create a sustainable new community of high quality design that meets or exceeds industry standards and incorporates state-of-the-art energy conservation and green practices in a Leadership in Energy and Environmental Design (LEED)-certifiable project. The project will require a maximum of 9.7 megawatts of power which would lead to indirect generation of GHG emissions. Hawaii is committed to renewable energy production, which does not generate GHG emissions. In 2016, 25.8 percent of energy produced by the Hawaiian Electric Companies was renewable. Hawaii has enacted a law that mandates that all of the State's electricity comes from renewable sources no later than 2045. The project is anticipated to be built in 2028. Project-related indirect emissions would decline between 2028 and 2045 as the State moves toward a fully renewable supply of energy.

Project emissions have been conservatively estimated using existing generation information and emission rates. The 2015 Hawaii State Electricity Profile indicates that approximately 1,600 pounds of carbon dioxide is emitted per megawatt-hour of electricity used. The analysis assumes that the average daily power use, including nighttime hours, at the project site would be 50 percent of the maximum power load. The indirect emissions from electricity use would be approximately 11,129 metric tons per year. These emissions would quickly decrease through 2045 as the State becomes fully reliant on renewable energy. Hawaiian Electric has stated there is existing capacity to service the project. The project would not interfere with the development of clean energy supplies and would not include a substantial on-site source of GHG emissions. The proposed project would locate in-fill development near existing public transportation and shopping areas, thereby reducing mobile source emissions compared to development located outside of urban areas. For example, the trip generation analysis prepared for the proposed project anticipates that walking/biking trips would reduce passenger vehicle trips by 10 percent, residential-related transit trips would reduce passenger vehicle trips by 30 percent, and retail-related transit trips would reduce passenger vehicle trips by 15 percent at full buildout. Energy conservation features and in-fill development benefits would ensure that the proposed project would not result in a significant GHG impact.

7.0 CUMULATIVE EFFECTS

7.1 Federal

The NEPA requires that any agency proposing a major federal action, which may significantly affect the environment, consider the environmental impacts of the proposed action, any unavoidable adverse environmental impacts, and the relationship between local short term uses and long term productivity of the environment (42 U.S.C. 4332(c)). There are three types or categories of effect that must be considered during the NEPA process: direct, indirect, and cumulative (40 CFR 1508.25). A direct effect is one which is caused directly by our activities, at the same time, and in the same place. An indirect effect is a reasonably foreseeable effect caused by the proposed action or alternatives, but that occurs later in time or is further removed from the project site than a direct effect. "Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate," and related effects on resources (40 CFR 1508.8(b)).

A cumulative effect is an "impact on the environment which results from the incremental effect of the action when added to other past, present, and reasonably foreseeable future actions" (40 CFR 1508.7). Cumulative effects can result from individually minor but collectively significant actions taking place over time (40 CFR 1508.7). A cumulative effects analysis is required whenever an EA or EIS is prepared. A project must have a direct and/or indirect effect on a specific resource to exert a cumulative influence. If no direct and/or indirect effect to a specific resource is expected, there is no need to consider cumulative effects to that resource. As previously discussed, the proposed project would not result in an adverse air quality effect. No further analysis is necessary. Therefore, a cumulative effect would not occur under NEPA regulations.

7.2 State

Section 11-200-2 of the Hawaii Administrative Rules contains the definition of a "cumulative impact" for Environmental Impact Statements. A "cumulative impact" is defined as the impact on the environment, which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

By its very nature, air pollution is largely a cumulative impact. Ambient air quality standards are violated or approach nonattainment levels due to past development that has formed the urban fabric, and attainment of standards can be jeopardized by increasing emissions-generating activity in the region. As shown in **Table 3-2**, above, monitored air quality concentrations are well below the NAAQS, which are health-based standards established by the USEPA. In addition, the proposed project is located in an Attainment/Unclassified area for all NAAQS. The regional air quality in the vicinity of Honolulu is considered to be healthy. There is no existing cumulative air quality impact, and there is no potential for the project to significantly contribute to a future air quality impact.

The State, through Act 234 and SB 559, has acknowledged that GHG emissions are a statewide impact. Emissions generated by the proposed project in combination with past, present, and reasonably probable future related projects could contribute to this impact. Although climate change is cumulative in nature, not every individual project that emits GHGs must necessarily be found to contribute to a significant cumulative impact on the environment. The project would create a sustainable new community of high quality design that meets or

exceeds industry standards and incorporates state-of-the-art energy conservation and green practices in a LEED-certifiable project. The project would not interfere with the development of clean energy supplies and would not include a substantial on-site source of GHG emissions. The proposed project would locate in-fill development near existing public transportation and shopping areas, thereby reducing mobile source emissions compared to development located outside of urban areas. For example, the trip generation analysis prepared for the proposed project anticipates that walking/biking trips would reduce passenger vehicle trips by 10 percent, residential-related transit trips would reduce passenger vehicle trips by30 percent, and retail-related transit trips would reduce passenger vehicle trips by 15 percent at full buildout. Energy conservation features and in-fill development benefits would ensure that the proposed project would not contribute to a cumulative GHG impact.

Mayor Wright Redevelopment –Multimodal Transportation Assessment
January 2018

1.0 EXECUTIVE SUMMARY

This report presents the results of the multimodal transportation assessment for the proposed Mayor Wright Housing redevelopment within the Kalihi area on the island of O`ahu. This document satisfies the requirement of a transportation impact analysis report (TIAR) but places additional emphasis on active transportation (i.e., biking and walking) and transit modes. The proposed project would replace one for one the existing 364 public housing units (based on the number of bedrooms in the existing units) with up to total of 2,500 residential units and up-to 80,000 square feet (s.f.) of retail and commercial uses. The project site is bounded by N King Street on the makai side, N Vineyard Boulevard on the mauka side, Liliha Street on the Diamond Head side, and Pua Lane on the ewa side. Mayor Wright would be built in five (5) phases with two-years of construction estimated for each phase. The project is projected to be fully constructed and occupied by Year 2028.

The impacts of the proposed project to the surrounding transportation system were evaluated following guidelines established by the City & County of Honolulu Department of Planning & Permitting (DPP) Traffic Review Branch (TRB) and the Hawaii Depart of Transportation – Highways Division (HDOT). The operations of 15 existing key intersections were evaluated during the weekday morning (AM) and evening (PM) peak hours for the following scenarios:

- Existing (2016)
- Near Term (2022) Conditions, which assumes partial development (half) of the project. This scenario analyzes conditions without and with the project.
- Long-Term (2028) Conditions, which assumes full buildout of the project. This scenario analyzes conditions without and with the project.

The project's trip generation estimates were developed using MainStreet, a web application developed by Fehr & Peers that uses the Mixed-Use (MXD+) Trip Generation Model. This MXD model was developed by Fehr & Peers and the Environmental Protection Agency (EPA) and is based on statistically superior data compared to the methodology used by ITE. The model recognizes that traffic generation by mixed-use and other forms of sustainable development relate closely to the density, diversity, design, destination accessibility, travel proximity, and scale of development. The model estimates the percentage of daily and peak hour trips that remain to the project site, as well as external transit, walk and vehicle mode splits. The vehicle trip reductions (i.e. walking, biking, transit) were further refined based on existing travel survey data provided in the *Kalihi Transit-Oriented Development Plan* (2014). The transit reduction was slightly increased to account for the new Iwilei rail station that would be located less than one-third of a mile from the project site. Based on this approach, the proposed project is estimated to generate the following net new vehicle trips:

- Partial Buildout (half of project): a total of 5,065 daily trips, including 235 trips during the AM peak hour (31 inbound/204 outbound), and 502 trips during the PM peak hour (310 inbound/192 outbound)
- Full Buildout: a total of 10,085 daily trips, including 578 during the AM peak hour (111 inbound/467 outbound), and 959 trips during the PM peak hour (590 inbound/369 outbound)

Table ES-1, shows the intersection impacts and under which project scenario those impacts would be triggered, the type of project impact (i.e. cumulative or project specific), and the recommended mitigation measures to mitigate those impacts.

TABLE ES-1: PROJECT IMPACTS

Intersection	Near Term (2022) Plus Partial Buildout	Year 2028 Plus Full Buildout	Impact Type	Recommended Traffic Mitigation Measures
7. N King Street / Dillingham Boulevard/Liliha Street	X	X	Cumulative	No feasible capacity enhancements available[1].
9. N Vineyard Boulevard / Liliha Street	X	X	Cumulative	Add a second eastbound left-turn lane on N Vineyard Boulevard
14. N Vineyard Boulevard / Aala Street	X	X	Cumulative	Restripe the southbound approach on Aala Street to include a separate left and shared through/right lane.

Source: Fehr & Peers, 2017

[1] There are no feasible roadway capacity enhancements that can be implemented at this intersection without of significant right-of-way acquisitions on other properties. Additionally, heavy congestion at this intersection is primarily attributed to regional traffic demand, and widening these roadways is beyond the scope of a single development project.

The three cumulative impacts (intersections 7, 9, and 14) that would be triggered in Near Term (2022) and Long-Term (2028) would also be impacted after the first phase of construction is completed, which is estimated to include approximately 650 residential units of development.

To reduce the project's transportation impact, the implementation of travel demand management (TDM) strategies is recommended to reduce the number of vehicle trips and increase the use of alternative modes. TDM strategies that could be considered include incentivizing residents and employees to carpool and take transit, providing secure on-site bicycle storage facilities, and developing parking management plans. A final TDM program should be developed in consultation with DPP staff.

In addition to implementing roadway capacity enhancements and TDM strategies, it is also recommended that pedestrian safety enhancements be implemented at the major adjacent intersections (i.e. N King

Mayor Wright Redevelopment –Multimodal Transportation Assessment
January 2018

Street/Dillingham Boulevard/Liliha Street and N Vineyard Boulevard/Liliha Street) to improve the pedestrian facilities near the site that would serve the existing and future demand. Those improvements include:

- Install Leading Pedestrian Intervals (LPIs) at all crosswalks
- Realign and straighten the existing crosswalk to reduce the crosswalk distance and improve pedestrian visibility
- Relocate the existing signal box and signal pole in the ewa-mauka corner of N King Street/Dillingham Boulevard/Liliha Street behind the crosswalk to improve pedestrian visibility.
- Relocate all pedestrian push buttons so that they are within 10 feet from the curb ramp.

Overall, while the proposed project is expected to increase walking, biking, and transit activity in the study area, the project's planned multimodal enhancements coupled with the planned agency improvements are expected to adequately serve the future demand. These improvements include the safety enhancements described above, the promotion of the use of passive and active spaces and non-motorized modes, and the implementation of planned Complete Streets projects, as well as the future rail system. Thus, the project's impacts to pedestrian, bicycle, and transit facilities and services are considered less than significant.

2.0 INTRODUCTION

This Multimodal Transportation Assessment fulfills the requirements of a transportation impact analysis report (TIAR), and presents the results of the mobility study conducted by Fehr & Peers for the redevelopment of Mayor Wright Housing in the Kalihi community on the island of O`ahu. The purpose of this analysis is to identify the impacts of the proposed project on the surrounding transportation system. The Multimodal Transportation Assessment includes a description of the assumptions and methods used to conduct the study, as well as a discussion of the results. This Multimodal Transportation Assessment was conducted in accordance with the guidelines and standards of the affected government agencies. **Figure 1** illustrates the study area, and **Figure 2** illustrates the proposed conceptual site plan.

2.1 PROJECT DESCRIPTION

The proposed project is the redevelopment of the existing 364 affordable housing units into a mixed-use development comprising residential and retail uses. The project will include up to 2,500 residential units and up to 80,000 square feet (s.f) of retail and commercial uses. The project site is bounded by N King Street on the makai side, N Vineyard Boulevard on the mauka side, Liliha Street on the Diamond Head side, and Pua Lane on the ewa side. Mayor Wright is estimated to be built in five (5) phases with approximately two-years of construction for each phase. The project is projected to be fully constructed and occupied by Year 2028.

Figure 1
Study Area

Figure 2
Project Site Plan

2.2 PROJECT STUDY AREA

The study analyzed the potential project-related traffic impacts during the typical weekday AM and PM peak hours under current conditions and two future scenarios. The transportation analysis evaluated the operations at 15 intersections in the vicinity of the proposed project. The analyzed intersections are listed below and are shown on **Figure 1**:

1. Dillingham Boulevard / Alakawa Street
2. N King Street / Palama Street
3. N Vineyard Boulevard / Palama Street
4. N King Street / Pua Lane
5. Kukui Street / Pua Lane
6. N Vineyard Boulevard / Pua Lane
7. N King Street / Dillingham Blvd / Liliha Street
8. Kukui Street / Liliha Street
9. N Vineyard Boulevard / Liliha Street
10. Kiapu Place / Liliha Street
11. N School Street / Liliha Street
12. N King Street / Iwilei Road
13. N Beretania Street / Aala Street
14. N Vineyard Boulevard / Aala Street
15. Dillingham Boulevard / Kaaahi Street

The operations of the study intersections were evaluated during the weekday morning (AM) and evening (PM) peak hours for the following scenarios:

- **Existing (2016) Conditions** – The analysis of existing traffic conditions was based on 2016 counts collected for the analyzed peak hours. The existing conditions analysis also includes a description of key area roadways and an assessment of bicycle, pedestrian, and transit facilities and services near the site.
- **Near Term (2022) Baseline Conditions** –This year reflects the completion of approximately half of the total development of the project. Year 2022 volumes were forecasted by applying an annual growth factor to the existing traffic counts. The growth counts were based on historic HDOT traffic counts and other transportation studies in the study area.
- **Near Term (2022) Plus Partial Buildout Conditions** – This traffic scenario provides projected traffic volumes and an assessment of operating conditions under Near Term Baseline Conditions

with the addition half of the project's development (partial buildout)-generated traffic. The near term impacts of the proposed project on future traffic conditions were identified.

- **Long-Term (2028) Baseline Conditions** – Future Year 2028 volumes in the anticipated completion year of the full project build-out were projected by increasing traffic volumes using an annual growth factor to account for ambient growth.
- **Long-Term (2028) Plus Full Buildout Conditions** – This traffic scenario provides projected traffic volumes and an assessment of operating conditions with full buildout of the proposed project after roughly 10+ years of background traffic growth.

2.3 TRAFFIC ANALYSIS METHODS

The analysis of roadway operations performed for this study is based on procedures presented in the *Highway Capacity Manual* (HCM), published by the Transportation Research Board in 2010. The operations of roadway facilities are described with the term level of service (LOS). LOS is a qualitative description of traffic flow based on such factors as speed, travel time, delay, and freedom to maneuver. Six levels are defined from LOS A, with the least congested operating conditions, to LOS F, with the most congested operating conditions. LOS E represents "at-capacity" operations. Operations are designated as LOS F when volumes exceed capacity, resulting in stop-and-go conditions. The methodologies for signalized and unsignalized intersections are described below.

2.3.1 SIGNALIZED INTERSECTIONS

The method described in Chapter 18 of the *Highway Capacity Manual 2010* was used to prepare the LOS calculations for the signalized study intersections. This LOS method analyzes a signalized intersection's operation based on average control delay per vehicle. Control delay alone is used to characterize LOS for the entire intersection or an approach. Control delay includes the initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. The average control delay for signalized intersections is calculated using Synchro 9.0 analysis software and is correlated to a LOS designation as shown in **Table 1**.

Mayor Wright Housing Redevelopment –Multimodal Transportation Assessment
January 2018

TABLE 1: SIGNALIZED INTERSECTION LOS CRITERIA

Level of Service	Description	Delay in Seconds
A	Progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.	≤ 10.0
B	Progression is good, cycle lengths are short, or both. More vehicles stop than with LOS A, causing higher levels of average delay.	> 10.0 to 20.0
C	Higher congestion may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level, though many still pass through the intersection without stopping.	> 20.0 to 35.0
D	The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.	> 35.0 to 55.0
E	This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences.	> 55.0 to 80.0
F	This level is considered unacceptable with oversaturation, which is when arrival flow rates exceed the capacity of the intersection. This level may also occur at high V/C ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be contributing factors to such delay levels.	> 80.0

Source: *Highway Capacity Manual*, Transportation Research Board, 2010.

2.3.2 UNSIGNALIZED INTERSECTIONS

The operations of the unsignalized intersections were evaluated either using the method contained in Chapter 19: Two-Way Stop-Controlled Intersections or Chapter 20: All-Way Stop-Controlled Intersections of the *HCM 2010*. LOS ratings for stop-sign-controlled intersections are based on the average control delay expressed in seconds per vehicle. At all-way stop-controlled intersections the overall intersection delay and LOS is reported, and the LOS is characterized solely on control delay. At two-way or side-street-controlled (TWSC) intersections, the average control delay is calculated for each minor-street stopped movement and the major-street left turns, not for the intersection as a whole. For approaches composed of a single lane, the control delay is computed as the average of all movements in that lane. For approaches with multiple lanes, the control delay is computed for each movement; the movement with the worst (i.e., longest) delay is presented for TWSC. As shown in the **Table 2**, LOS F is assigned to the movement if the volume-to-capacity (V/C) ratio for the movement exceed 1.0 regardless of control delay. The average control delay for unsignalized intersections is calculated using Synchro 9.0 analysis software and is correlated to a LOS designation as shown in **Table 2**.

TABLE 2: UNSIGNALIZED INTERSECTION LEVEL OF SERVICE DEFINITIONS

Level of Service	Description	Average Control Delay Per Vehicle (Seconds)
A	Little or no delay.	≤ 10.0
B	Short traffic delay.	> 10.0 to 15.0
C	Average traffic delays.	> 15.0 to 25.0
D	Long traffic delays.	> 25.0 to 35.0
E	Very long traffic delays.	> 35.0 to 50.0
F	Extreme traffic delays with intersection capacity exceeded.	> 50.0

Source: *Highway Capacity Manual*, Transportation Research Board, 2010.

Notes:

[1] For approach-based and intersection-wide assessments, such as that used for AWSC intersections, LOS is defined solely by control delay.

2.3.3 SIGNIFICANT IMPACT CRITERIA

The analysis of Near Term (2022) and Long-Term (2028) Conditions compares future baseline operations with conditions when the project is partially and fully built out, respectively, to determine whether or not project traffic is expected to result in a significant operational impact on the surrounding roadways. Based on previous studies conducted for the City & County of Honolulu Department of Planning and Permitting (DPP) Traffic Review Branch (TRB), the minimum desired operating standard for a signalized intersection is typically LOS D. Additionally, the Hawaii Department of Transportation (HDOT) strives to maintain LOS D intersection operations and has jurisdiction over two of the streets fronting the project site. Both agencies usually define a significant intersection impact when the operation of an intersection or turning movement changes from LOS D or better to LOS E or F. Impacts are also defined to occur when the addition of project traffic exacerbates locations already operating or projected to operate at LOS E or F. When evaluating intersection operations at any location, other factors are considered in the analysis, such as traffic volumes, volume-to-capacity (V/C) ratios (should ideally be less than 1.00), and secondary impacts to pedestrian, bicycle, and transit travel.

Each of the identified significant impacts is categorized as either a project-related or cumulative impact. If the addition of project traffic is expected to degrade LOS D or better operations to LOS E or F at a signalized intersection, then the project is considered to have a project-specific impact. An impact is considered a

Mayor Wright Housing Redevelopment –Multimodal Transportation Assessment
January 2018

cumulative impact at a signalized intersection if the addition of project trips exacerbates LOS E or F operations.

For unsignalized intersections, the project is determined to have a significant project-specific impact if the addition of project traffic causes an unsignalized intersection to degrade from LOS D or better to LOS E or F and if the peak hour signal warrant is satisfied. An impact is considered a cumulative impact when it adds traffic to a study location that includes a controlled approach that operates at an undesired level (i.e., LOS E or F) and if the peak hour signal warrant is satisfied. The peak hour warrant is one of several key indications as to whether a traffic signal may be needed at a given location.

TRB and DOT do not publish impact criteria for pedestrian, bicycle, and transit impacts. However, these impacts are generally evaluated based on whether a proposed project would: 1) conflict with existing or planned pedestrian, bicycle, or transit facilities, or 2) create walking, bicycling, or transit use demand without providing adequate and appropriate facilities for non-motorized mobility. The existing amenities for pedestrians, bicycles, and transit users were inventoried to evaluate the quality of the facilities in place today. The assessments of planned facilities outlined in planning documents, such as the *O`ahu Bike Plan* and the *Honolulu High-Capacity Transit Corridor Project Final Environmental Impact Statement*, were used to evaluate future conditions for non-automobile modes. For these modes, if the proposed project is expected to conflict with existing or planned improvements to pedestrian and bicycle facilities, or if the project is expected to generate a substantial demand which could warrant additional transit service, then the project is expected to have a project-specific impact.

2.4 REPORT ORGANIZATION

This report is divided into eight chapters. The existing transportation system serving the project site and the current operating conditions of the key intersections are described in **Chapter 3** Existing Conditions. **Chapter 4** describes the project trip generation, distribution, and assignment used in the transportation impact analysis. **Chapter 5** summarizes the methodologies used to forecast the future traffic volumes and presents the analysis for Near Term (2022) Baseline Conditions. **Chapter 6** represents the analysis for the Near Term (2022) Plus Partial Buildout Conditions. **Chapter 7** summarizes the methodologies used to forecast the Long-Term (2028) traffic volumes and presents the analysis for Long-Term (2028) Baseline Conditions. **Chapter 8** represents the analysis for the Long-Term (2028) Plus Full Buildout Conditions and identifies any project impacts. **Chapter 9** discusses mitigation measures to address any project impacts. **Chapter 10** contains an assessment of the site access and on-site circulation of the proposed project, while **Chapter 11** includes an assessment of the potential future effect of the project on existing and future transit, bicycle, and pedestrian facilities.

3.0 EXISTING CONDITIONS

This chapter describes the existing roadway network and includes a discussion of the bicycle, pedestrian, and transit facilities located in the project study area. This chapter also includes a discussion of the existing intersection LOS results.

3.1 EXISTING TRANSPORTATION FACILIITIES

A comprehensive data collection effort was undertaken to identify existing transportation conditions in the vicinity of the proposed project. The assessment of existing conditions relevant to this study includes an inventory of the street system, traffic volumes on these facilities, and operating conditions at key intersections. Existing public transit service and bicycle and pedestrian facilities are also described.

3.1.1 EXISTING ROADWAY SYSTEM

The key roadways providing access to or in the vicinity of the site are described below. **Figure 1** illustrates the proposed project location and the surrounding roadway system, and **Figure 3** shows the street segment ownership within the study area. The source of the roadway ownership data is based on the City and County of Honolulu's Open Geospatial Data Portal.

H-1 serves a major east-west connection between Kapolei and the Primary Urban Center (PUC) of Honolulu. The freeway is generally six lanes (three in each direction) within the study area. Existing partial interchanges within the project vicinity are provided at Liliha Street, Nuuanu Avenue, Palama Street, and Vineyard Boulevard. The nearest full interchange to the project site is the Pali Highway interchange, which is located a little less than a mile away.

North King Street is a major arterial on the makai side of the project site that extends in the ewa-Diamond Head direction from Middle Street to Kapi`olani Boulevard. Within the project area, N. King Street is an undivided four-lane arterial with a posted speed limit of 25 miles per hour (mph), and is fronted by a wide variety of community-oriented facilities, including churches, schools, residential units, and retail centers. N. King Street is a parallel facility to H-1 and serves the PUC of O`ahu; therefore, during the AM and PM peak periods, this roadway experiences substantial peak period vehicle demand resulting in congestion queuing.

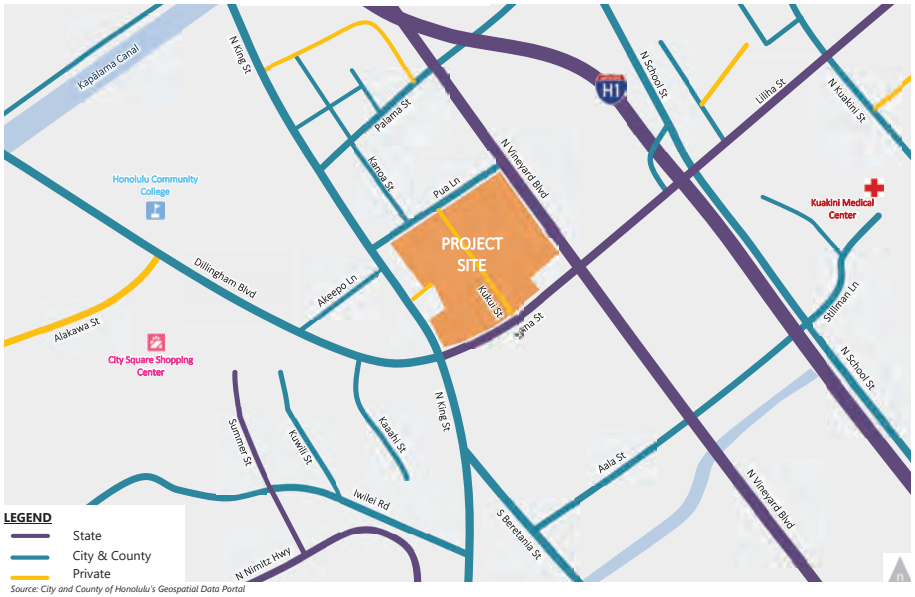

Figure 3
Roadway Ownership

Liliha Street is a major mauka-makai arterial that provides direct access to the project site at the Kukui Street signalized intersection. Within the project area, this roadway contains four travel lanes, two in each direction, with separate or shared left-turn lanes at signalized intersections. This roadway is under HDOT's jurisdiction and provides regional access via N. School Street and H-1 interchange; thus, Liliha Street serves high traffic volumes during the AM and PM peak periods, and long mauka-bound queues heading towards the H-1 interchange were observed during both peak hours.

Pua Lane is a mauka-makai two-lane local street on the ewa side of the project site. This roadway connects North King Street to Vineyard Boulevard, and provides direct access to the project site via an unsignalized intersection at Kukui Street. Traffic volumes on this roadway are relatively low and vehicle delays are typically negligible. On-street parking is well utilized during the day, primarily serving Mayor Wright residents and single- and multi-family residences on the ewa side of Pua Lane.

North Vineyard Boulevard is a major ewa-Diamond Head arterial that extends from Olomea Street/H-1 in the ewa direction to H-1 beyond Aala Street on the Diamond Head side. Vineyard Boulevard is an undivided roadway with six travel lanes (three in each direction) and has a posted speed limit of 30 mph. Similar to N. King Street, Vineyard Boulevard is a parallel facility to H-1, and therefore, serves significant traffic volumes during the AM and PM commute periods when the freeway is congested. North Vineyard is under HDOT's jurisdiction and provides access to H-1.

Dillingham Boulevard is a four-lane undivided ewa-Diamond Head arterial with a posted speed limit of 35 mph in the study area. On the ewa side, it connects to H-1 and Nimitz Highway at Middle Street and extends in the Diamond Head direction to N King Street, where it then transitions to Liliha Street. This roadway provides access to multiple shopping centers, schools, and industrial uses.

3.1.2 EXISTING TRANSIT SERVICES

"TheBus" is O`ahu's provider of public transit. Transit ridership among residents in the area is significantly high, and the study area is well served by frequent bus service provided immediately adjacent to the project site on N King Street, Liliha Street, Vineyard Boulevard, and N School Street. The nearest bus stop to the project site is located on Liliha Street near the Kukui Street intersection, which is located approximately 100 feet from the existing Mayor Wright driveway. Additionally, the N King Street bus stop is also located approximately 100 feet from the existing pedestrian access point at the mauka-ewa corner of the N King Street/Dillingham Boulevard/Liliha Street intersection.

The center of the site is also located a short distance away (i.e. roughly a 1,000 foot walk) from the planned Iwilei Station that will provide access to rail transit line currently under construction. The station will be located at the makai-Diamond Head corner of the Dillingham Boulevard/Kaaahi Street intersection. This

Mayor Wright Housing Redevelopment –Multimodal Transportation Assessment
January 2018

system will provide more reliable and faster transit service from East Kapolei to Ala Moana Shopping Center, and will allow some residents and employees of the proposed project, to travel to and from the area without the need for a private vehicle. The farthest area of the project site from the Iwilei Station, which is the corner near Vineyard Boulevard and Pua Lane, will be roughly a 1/3-mile walk to the transit station, which is still considered a reasonable distance to access rail transit service on a regular basis.

There are 32 fixed-route bus lines that serve the study area:

Figure 4 illustrates the existing and planned transit facilities and services within the greater study area.

Figure 4
Existing and Planned Transit Facilities

3.1.3 EXISTING BICYCLE FACILITIES

Bicycle facilities generally consist of three types of facilities, which are outlined below:

- *Bike or Shared Use Paths* provide a completely separate right-of-way and is designated for the exclusive use of bicycles and pedestrians with vehicle and pedestrian cross-flow minimized. Generally, the recommended pavement width for a two-directional shared use path is ten (10) feet.

- *Bike Lanes* provide a restricted right-of-way and are designated for the use of bicycles with a striped lane on a street or highway. Bicycle lanes are generally five (5) feet wide. Adjacent vehicle parking and vehicle/pedestrian cross-flow are permitted.

- *Bike Route or Signed Shared Roadways* provide for a right-of-way designated by signs or shared lane pavement markings, or "sharrows," for shared use with pedestrians or motor vehicles.

As depicted in **Figure 5**, no bicycle infrastructure is provided within the direct proximity of the project site, though existing bicycle facilities do serve adjacent community areas. Cyclists must share the travel lane with vehicles; however, given the heavy traffic volumes on the adjacent streets, the majority of cyclists ride

on the sidewalks, which creates potential conflicts between bicycles and pedestrians along the narrowest sidewalk sections.

Bicycle infrastructure will be expanded and developed as planned land uses are built and occupied. The *Oah'u Bike Plan* calls for new bicycle lanes on N. King Street and Liliha Street, and a new bicycle route on Dillingham Boulevard. Implementation of separate bicycle lanes (Class II facilities) will require roadway restriping and/or the elimination of parking and vehicle travel lanes. The City & County of Honolulu is currently conducting complete streets planning efforts to identify specific multi-modal improvements in this area including at the intersection of N. King Street and Liliha Street-Dillingham Boulevard.

3.1.4 EXISTING PEDESTRIAN FACILITIES

Pedestrian facilities consist of sidewalks, crosswalks, and pedestrian signals at signalized intersections. The project area has notably high pedestrian activity and is generally well-served by pedestrian infrastructure. All roadways in the immediate vicinity of the project site include sidewalks on both sides of the street. Sidewalks between the project site and the proposed Iwilei rail transit station are in good condition with some shaded areas provided by trees (although the tree canopy could be enhanced. Sidewalks on North King Street, Liliha Street, and Vineyard Boulevard area minimum of eight feet wide and well-maintained. Though there are a few obstructions on the sidewalks (such as utility poles, bus shelters, and trees), adequate space is generally provided to accommodate the level of pedestrian activity on those streets. Although not as wide or aesthetic, the sidewalks on Pua Lane are also in fairly good condition.

The signalized intersections surrounding the project site includes marked crosswalks on all intersection approaches, with the exception of the south leg of the N King Street/Dillingham Boulevard – Liliha Street intersection. Typically, crosswalks are not provided on selected intersection approaches to facilitate vehicle travel to reduce the number of signal phases and/or to avoid pedestrian conflicts with dual right-turn lanes. Ideally, sidewalks and crosswalks are provided on all approaches to encourage walking as a primary travel mode and to enhance safety. In addition, an uncontrolled marked crosswalk is provided on Pua Lane on Kanoa Street to raise driver awareness and to guide pedestrians to a specific crossing point.

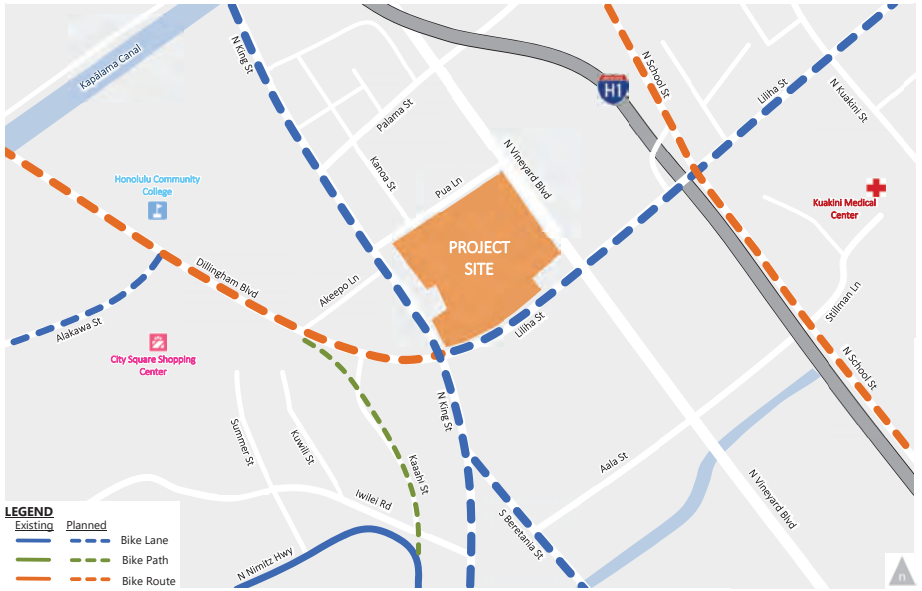

Figure 5
Existing and Planned Bicycle Facilities

3.2 EXISTING INTERSECTION VOLUMES AND LANE CONFIGURATIONS

The operations of the 14 existing study intersections were evaluated during weekday morning (6:00 to 8:00 AM) and evening (3:15 to 5:15 PM) peak-period conditions. Traffic counts were collected during the weekday AM and PM peak periods at the study intersections in August 2016, when local schools were in session. The weekday AM peak hour of traffic for the study area generally occurs between the hours of 7:00 AM and 8:00 AM. During the weekday afternoon/evening, the PM peak hour of traffic generally occurs between the hours of 3:45 PM and 4:45 PM.

Existing lane configurations and signal controls were obtained through field observations. **Figure 6** presents the existing AM and PM peak-hour turning movement volumes, corresponding lane configurations, and traffic control devices. Raw traffic count data sheets are provided in **Appendix A**.

3.3 FIELD OBSERVATIONS

Field observations were conducted to identify existing traffic operational deficiencies and to confirm the accuracy of calculated levels of service. The purpose of this effort was to (1) to identify any existing traffic problems that may not be directly related to intersection level of service and (2) to identify any locations where the level of service calculation does not accurately reflect level of service in the field. Field observations were conducted on midweek day in August 2016 during the same time day traffic counts were conducted.

Vehicle queues, pedestrian/bicycle activity, and bus operations were observed on Liliha Street, Dillingham Boulevard, Vineyard Boulevard, N King Street, Pua Lane, and Aala Street. During both AM and PM peak hours, the following traffic congestion was observed:

- Substantial vehicle delays occur at the N King Street/Dillingham Boulevard – Liliha Street, especially during the PM peak hour. The Liliha Street makai-bound approach includes a left-turn, a shared left/through, and a shared through/right lane. Currently, the signal phasing on Liliha Street-Dillingham Boulevard provides protected phasing for the makai-bound left-turn and through movements; consequently, when a left-turning vehicle is in the shared left/through lane and is waiting at red left-turn light, it blocks makai-bound through traffic in that lane and results in a queue buildup on Liliha Street. Similarly, the Diamond Head-bound approach on King Street has the same signal phasing as Liliha Street with a shared left/through lane that will block through movements when waiting for the green arrow and results in queue buildup on N King Street.

  Improvements to increase existing capacity at this location would likely require right-of-way acquisition, tree removal, signal modifications, and re-striping.
- Congestion and slow moving mauka-bound queues occur on Dillingham Boulevard-Liliha Street from Akeepo Lane to the H-1 Freeway ramps. As mentioned in the *Roadways* section, Dillingham Boulevard-Liliha Street provides regional access via the N King Street intersection and the H-1 Freeway, and therefore serves heavy vehicle volumes during the AM and PM peak periods. Furthermore, Liliha Street serves multiple bus routes with bus stops in between N King Street and Vineyard Boulevard, with no designated bus turnouts on Liliha Street. Consequently, when a bus is loading and unloading passengers at the stops, occasionally it blocks through traffic in the outside travel lane and impedes traffic flow on Liliha Street.

Frequent pedestrian activity was observed on the major study corridors (i.e. Liliha Street, Dillingham Boulevard, Vineyard Boulevard, and N King Street) during both peak hours. The study area is very dense with various land uses, such as schools, retail centers, residential units, industrial/office complexes, which is ideal from a walkability standpoint since a person can simply walk to their destination instead of drive because the distance is fairly close. The N King Street/Liliha Street/Dillingham Boulevard and the Liliha Street/Vineyard Boulevard intersections are located near major bus stops and retail centers, so both intersections serve relatively high pedestrian volumes during the peak commute hours. A pedestrian call was observed at each leg of the intersection during each signal cycle at both of these intersections.

Minimal bicycle activity on the study roadways was observed during the peak hours. Since no separate bicycle facilities are currently provided in the study area, the limited number of bicyclists traveling on the roadways was not unexpected. Most bicyclists were observed riding on the sidewalks on N King Street or Liliha Street as they likely perceive that it provides a safer ride compared to riding on these roadways with high vehicle volumes.

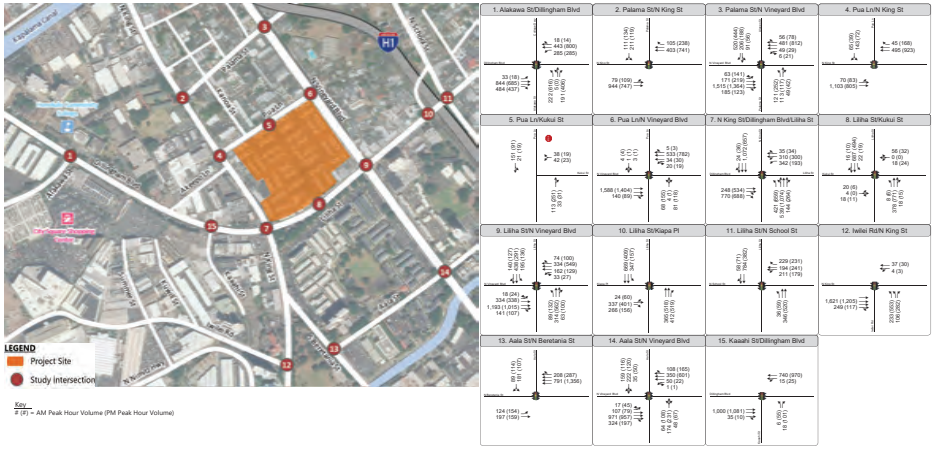

Figure 6
Peak Hour Traffic Volumes and Lane Configurations
Existing (2016) Conditions

3.4 EXISTING INTERSECTION LEVELS OF SERVICE

Existing peak-hour volumes and lane configurations were used to calculate levels of service for each of the study intersections. The results of the existing LOS analysis are presented in **Table 3** and the corresponding LOS calculation sheets are included in **Appendix B**.

TABLE 3: EXISTING (2016) INTERSECTION LEVELS OF SERVICE

Source: Fehr & Peers, 2017.
Notes:
[1] SSSC = Side-street stop controlled
[2] Whole intersection weighted average stopped delay expressed in seconds per vehicle for signalized and all-way stop-controlled intersections. The vehicular delay for the worst movement is reported for side-street stop-controlled intersections.
[3] LOS calculations performed using the *Highway Capacity Manual (HCM) 2010* method. LOS for side street stop-controlled (SSSC) intersections is worst-case movement. Other uncontrolled movements generally operate well with limited delay.
[4] Undesired LOS and corresponding seconds of delay per vehicle are highlighted in **bold.**
* During the peak hours, mauka-bound queues on Dillingham Blvd will spillback from the N King St intersection through the Kaaahi St intersection. This occurs a few times throughout the peak hour and during this time, delays appear longer than the average peak hour delay reported in the table.

The results of the LOS calculations indicate that all study intersections operate at an overall desirable service level (LOS D or better), with the exception of the following two (2) intersections:

7. N King Street / Dillingham Boulevard/Liliha Street – LOS F (PM Peak Hour)
9. N Vineyard Boulevard / Liliha Street – LOS F (AM and PM peak hours)

The remaining 13 study intersections operate at a desirable LOS (D or better) at an overall intersection-level during both peak hours. However, it should be noted that some individual turning movements/approaches operate below LOS D even when the overall intersection is operating at a desirable LOS. Movements operating at LOS E or F during peak periods is not uncommon, especially on high volume, urban arterials and are only considered notable problems when they negatively impede other turning movement flows.

The majority of the poorly operating movements are left-turn movements. This is attributed to the existing signal timing allocating more green time to the through movements, which in most cases, will cause the left-turn movements to operate at LOS E or F in at least one of the peak hours. For left-turns

operating poorly at unsignalized intersections, this is primarily due to the high traffic volume on the major streets (e.g. Vineyard Boulevard, Liliha Street, N King Street) and limited number of gaps for vehicles at the stop-controlled movement to make left-turns.

4.0 PROJECT TRAFFIC PROJECTIONS

This chapter describes the anticipated number of vehicle trips and directionality of those trips that would result from implementation of the proposed project. Future traffic added to the roadway system by the project is estimated using a three-step process: (1) project trip generation, (2) trip distribution, and (3) trip assignment. The first step estimates the amount of project-generated traffic will be added to the roadway network. The second step estimates the direction of travel to and from the project site. The new trips are assigned to specific street segments and intersection turning movements during the third step. This analysis analyzed the following two project scenarios:

- Partial Buildout under Near Term (2022) Conditions
- Full Buildout under Long-Term (2028) Conditions

This process is described in more detail in the following sections.

4.1 PROJECT TRIP GENERATION ESTIMATES

The project's trip estimates were based on four (4) sources of data:

- Existing peak hour driveway counts
- Trip Generation 9th Edition
- MainStreet (Fehr & Peers' MXD+ web app)
- Existing commute survey

The proposed new residential and retail uses would generate traffic that would replace the traffic currently generated by the existing Mayor Wright residences. Vehicle trips are estimated based on standard rates published in the *Trip Generation* (9th Edition, 2012) by the Institute of Transportation Engineers (ITE), including adjustments to account for internal vehicle trips and non-motorized trips given the mix of land use proposed and the location of the project relative to other facilities.

The combined effects of the project's land use, location, and development scale would contribute to a reduction in off-site average weekday vehicle trips. This reduction is attributed primarily to the project's proximity to existing transit services or walking distances to complimentary land uses, as well as the interaction between the residential units and retail uses.

The anticipated internalization of trips generated by complementary uses within the project site was estimated using MainStreet, a web application developed by Fehr & Peers that uses the Mixed-Use (MXD+) Trip Generation Model. This MXD+ model was developed by Fehr & Peers and the Environmental Protection Agency (EPA) and is based on statistically superior data compared to the methodology used by

ITE. The model recognizes that traffic generation by mixed-use and other forms of sustainable development relate closely to the density, diversity, design, destination accessibility, travel proximity, and scale of development. The model estimates the percentage of daily and peak hour trips that remain to the project site, as well as external transit, walk and vehicle mode splits.

In addition, the vehicle trip generation was further reduced to account for the proximity of the future Iwilei rail transit station, and for trips that would be made by bicycling and walking to and from the station. Studies have shown that transit stations have the greatest effect within a ¼-mile radius, and that people are willing to walk up to ½-mile to a station. The City and County's TOD policy incorporates a ¼-mile radius for planning purposes, and the flat terrain, well maintained pedestrian infrastructure, and excellent weather conditions in the study area will make the transit line an option for numerous residents and retail shoppers. Transit trip reductions are typically greater for residential units in proximity to rail stations as compared to employment and other non-residential uses. Previous TOD research has shown relatively high vehicle reductions from ITE rates in other areas such as Portland, Philadelphia, the San Francisco Bay Area, and Washington D.C. According to the *Journal of Public Transportation* (Volume 1, No. 3, 2008), vehicle reductions at TOD sites can range from 25% to 60%.

According to the *Kalihi Transit-Oriented Development Plan* (2014), approximately 28% of the residents in Kalihi currently take transit as their form of transportation for their work commute. While the future rail station would increase the transit ridership in the area, it is not expected to substantially increase from existing as majority of the new rail riders would be patrons who previously took a different form of transit (e.g. bus) and would shift to rail for their commute. We conservatively estimated the following transit reductions for the analysis:

Partial Buildout – Near Term Conditions (this scenario does not assume rail as it represents Year 2022 and rail is anticipated to open in Year 2025 or later)

- 25% for residential – while the existing transit ridership is approximately 28 percent, the ITE trip rates that were used to calculate the vehicle trips for the residential uses already account for some level of transit ridership in the rates. Therefore, to avoid double counting, the existing transit ridership was decreased slightly and the resulting reduction was applied to the vehicle trip estimates.
- 10% for retail

Full Buildout – Long-Term (2028) Conditions (this scenario assumes rail transit is operational)

- 30% for residential (2% increase over existing)
- 15% for retail

The last set of reductions applied to project trips was for pass-by retail trips. Pass-by trips are made by those vehicles already passing by the site on Liliha Street (where the existing driveway is), and those vehicles

would simply turn into and out of the site during a trip that is already being made. In this case, pass-by trips are not new trips generated by the site or new to the roadway network, but still comprise a portion of site-generated traffic at its driveways. A 25 percent pass-by reduction was applied to the retail uses. This reduction was obtained from the *ITE Trip Generation Manual* and is a standard approach for retail uses.

Lastly, since the project site currently serves trips traveling to and from the existing Mayor Wright development, the existing trips were credited towards the project's net vehicle trip generation as those trips are already traveling on the network and are not considered new trips. We used the existing peak hour driveway counts to calculate the existing site's peak hour trip generation.

Table 4 and **Table 5** displays the project's trip generation estimate for Partial Buildout and Full Buildout conditions, respectively. For Partial Buildout, the project is estimated to generate approximately 5,065 net new daily vehicle trips, 235 net new AM peak hour trips (31 inbound/204 outbound), and 502 net new PM peak hour trips (310 inbound/192 outbound). For Full Buildout, the project is estimated to generate approximately 10,085 new daily vehicle trips, 578 net new AM peak hour trips (111 inbound/467 outbound), and net new 959 PM peak hour trips (590 inbound/369 outbound). The MXD (i.e. internalization and walking/biking trips) and future transit reductions is approximately 50 percent, which accounts for the mixed-use nature of the land use where vehicle trips would be linked (e.g. residential-retail interplay), and/or replaced with walk, bike, and transit trips to nearby land uses.

January 2018

4.2 PROJECT TRIP DISTRIBUTION

An initial trip distribution estimate was based on a "select zone" analysis using the O`ahuMPO Regional Travel Demand Forecasting Model (TDFM). This process identifies the number of trips on each roadway segment included in the model that is generated by the single traffic analysis zone (TAZ) representing the project area. The distribution was further refined and adjusted based on:

- Existing traffic volumes
- Level of accessibility of route to and from the project site
- Location of complementary land uses (retail centers and schools from which residents would be drawn)
- Locations of other similar land uses

Based on these factors, the vehicle trip distribution of the project-generated traffic under Near Term (2022) Conditions and Long-Term (2028) Conditions is estimated to be:

Residential Trip Distribution

- 8% to/from South along Dillingham Boulevard
- 2% to/from East along Alakawa Street
- 2% to/from the City Square Shopping Center along Dillingham Boulevard
- 9% to/from the West along N King Street
- 17% to/from the West along H-1
- 7% to/from the West along Alaneo Sreet
- 12% to/from the East along Vineyard Boulevard
- 10% to/from the East (to/from Town) along H-1
- 5% to/from the North along Liliha Street
- 1% to/from the West along N School Street
- 3% to/from the South along Iwilei Road
- 24% to/from the East (to/from Town) along N King Street/N Beretania Street

Retail Trip Distribution

- 9% to/from South along Dillingham Boulevard
- 1% to/from East along Alakawa Street
- 10% to/from the West along N King Street
- 15% to/from the West along H-1
- 5% to/from the West along Alaneo Sreet
- 10% to/from the East along Vineyard Boulevard
- 10% to/from the East (to/from Town) along H-1
- 20% to/from the North along Liliha Street
- 5% to/from the West along N School Street
- 15% to/from the East (to/from Town) along N King Street/N Beretania Street

Figure 7 illustrates the project trip distribution pattern described above.

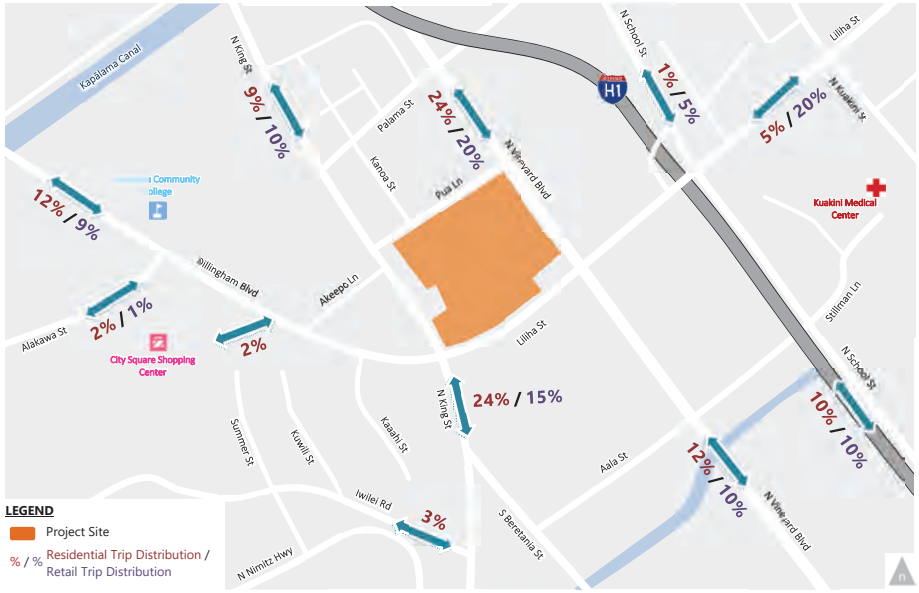

Figure 7
Project Trip Distribution

4.3 PROPOSED PROJECT ROADWAY MODIFICATIONS

The proposed project plans to construct the following driveways to provide access to the project site and to better distribute vehicle trips to the adjacent network:

- Liliha Street/Kukui Street Full Access Driveway – existing signalized driveway
- Vineyard Boulevard/Project Driveway Right-in-right-out – new side-street-stop-controlled driveway
- Pua Lane/Mauka Project Driveway – new side-street-stop-controlled driveway
- Pua Lane/Kanoa Street/Makai Project Driveway – new side-street-stop-controlled driveway

The site plan also shows an access on the makai side of the site on N King Street. This access would be pedestrian and bicycle access only. Further explanation on why this driveway does not allow vehicle access is described in Section 10.1 of this report.

All project driveways were assumed to be open during both the Near Term (2022) and Long-Term (2028) Conditions.

4.4 PROJECT TRIP ASSIGNMENT

Using the estimated trip generation, the distribution patterns, and the proposed roadway modifications discussed previously, the traffic generated by the proposed project under Near Term (2022) and Long-Term (2028) Baseline Conditions was assigned to the study intersections based on the characteristics of the streets within the study area, anticipated congestion, and directness of route. **Figure 8 and 9** shows the assignment of trips generated by the project for Partial Buildout and Full Buildout, respectively.

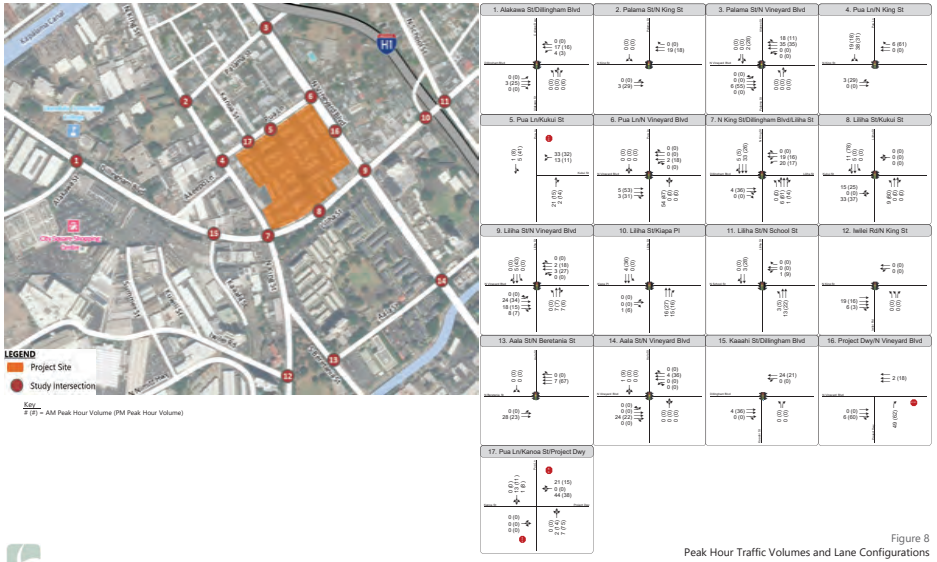

Figure 8
Peak Hour Traffic Volumes and Lane Configurations
Partial Buildout Project Trips

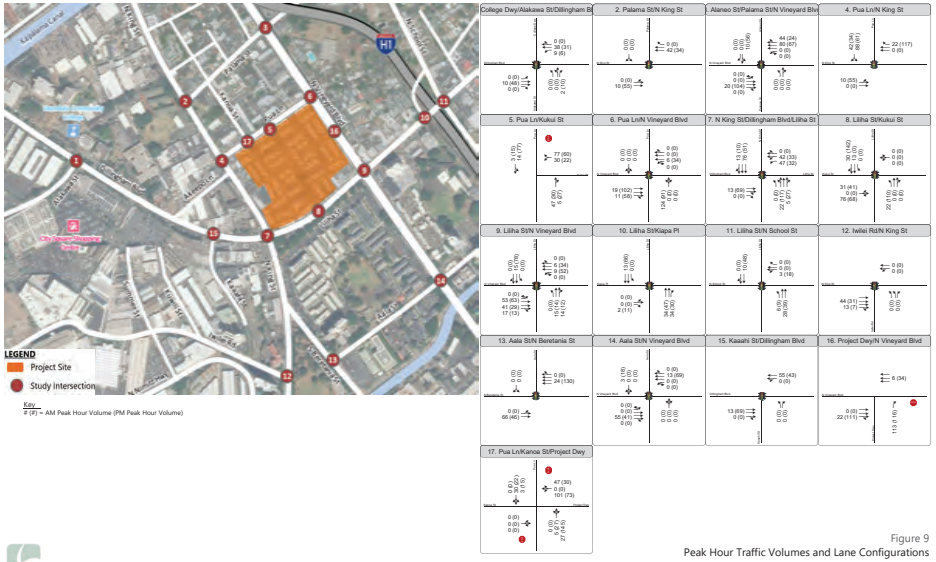

Figure 9
Peak Hour Traffic Volumes and Lane Configurations
Buildout Project Trips

5.0 NEAR TERM (2022) BASELINE CONDITIONS

To evaluate the potential impacts of traffic generated by the proposed project on the surrounding street system, it was necessary to first develop estimates of future traffic conditions in the area without the project. Future traffic conditions without the project reflect traffic increases due to regional growth and development. These conditions are referred to as the baseline condition (i.e., "no project" condition). The forecasted future or cumulative baseline traffic volumes were then used to identify impacts on the roadway system. Development of these future traffic scenarios is described in this chapter.

5.1 NEAR TERM (2022) TRAFFIC ESTIMATES

The following section summarizes the growth assumptions used to estimate the amount of traffic that would be adding to existing intersection volumes to develop volume estimates for Near Term (2022) Conditions.

5.1.1 AREAWIDE OR AMBIENT TRAFFIC GROWTH

A growth factor was individually applied to the traffic of each intersection's approach to account for future regional growth. This scenario would not include the future rail in place as the opening year for the rail is anticipated for Year 2025 or later. Therefore, historic HDOT traffic counts of the roadway system in the study area from 2013, 2014, and 2015 were compared to identify the amount of growth for this area in the near term. However, the review of these volumes did not reveal a clear trend in the roadway system's growth as some of the annual fluctuations in volumes were negative from one year to the next , positive during subsequent years, then negative again up to the latest year, 2016. Accordingly, 0.5 percent annual growth factor was applied to the existing intersection traffic volumes collected in August 2016 to assume some level of regional growth and to provide a more conservative analysis. This growth rate is considered reasonable given the urban and dense nature of the adjacent areas and the builtout nature of the surrounding neighborhoods. This growth rate was compounded over the six-year timeframe (2016 to 2022) when partial development of the proposed project is anticipated.

5.1.2 APPROVED PROJECTS

Future base traffic forecasts also include the effects of specific approved, planned, and/or proposed developments, expected to be constructed within the project's six-year development timeframe of partial development and expected to add traffic near the project site. One cumulative project was identified in the greater study area and that future development was subsequently added to the cumulative base traffic projections for 2022.

The Liliha Civic Center is a Department of Accounting and General Services (DAGS) project that plans to consolidate the state services into one location on Kaaahi Street ewa of Iwilei Road. The site is generally bound by Kaaahi Street on the makai side, N King Street on the mauka side, Iwilei Road on the ewa side, and existing buildings on the Diamond Head side. According to the "GCA Membership Meeting" presentation by DAGS, dated August 18, 2015, the Liliha Civic Center project will comprise affordable rental housing units and a building with a maximum of 300,000 square feet of developed space. The affordable housing units have already been constructed as the Iwilei Senior Residence project, but the proposed civic center building is still being planned. The proposed civic center is planned to be a mixed-use development that could include, but not limited to, office space and housing. Given that the details of the proposed civic center was unknown during the time of this study, an assumption of 300,000 square feet of office space was used to generate the largest amount of vehicle trips and provide a more conservative analysis.

The proposed Liliha Civic Center is estimated to generate approximately a total of 2,118 daily vehicle trips, 323 AM peak hour vehicle trips (284 inbound; 39 outbound), and 290 PM peak hour vehicle trips (49 inbound, 241 outbound). To provide a more conservative analysis, no reduction was taken for existing uses on this site. However, a trip reduction for transit of 30% was applied assuming that bus (and shortly rail in 2025) will provide a convenient mode to access the site. The Liliha Civic Center trips were then assigned to the roadway network and added to the ambient 2022 background volume.

5.1.3 NEAR TERM (2022) BASELINE STREET SYSTEM IMPROVEMENTS

Based on a review of public documents, including O`ahu's *Transportation Improvement Program for Fiscal Years 2015-2018* and the *O`ahu Regional Transportation Plan 2040*, no substantive roadway improvements or transportation system changes are projected to occur through 2022 in the immediate vicinity of the project site and more specifically at the study intersections. Therefore, the Near Term Baseline traffic network is assumed to remain the same as Existing Conditions. **Figure 10** shows the traffic volumes and lane configurations under Near Term (Year 2022) Baseline Conditions

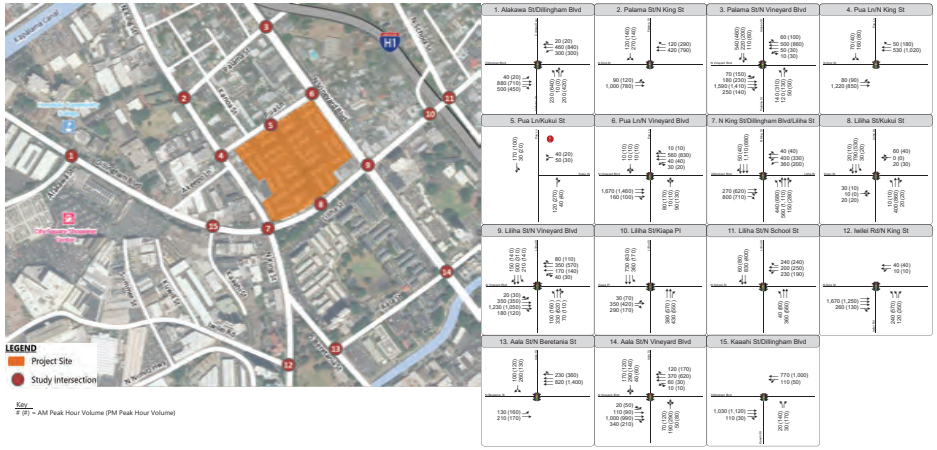

Figure 10
Peak Hour Traffic Volumes and Lane Configurations
Year 2022 Baseline Conditions

5.2 NEAR TERM (2022) BASELINE LEVELS OF SERVICE

Levels of service calculations were conducted to evaluate the operating levels of the study intersections under Near Term (2022) Baseline Conditions based on the projected growth in traffic and the anticipated roadway improvements. The results of the LOS analysis for the study intersections under Near Term (2022) Baseline Conditions are presented in **Table 6.** The corresponding LOS Calculation sheets are included in **Appendix C**

Source: Fehr & Peers, 2017.
Notes:
[1] SSSC = Side-street stop controlled
[2] Whole intersection weighted average stopped delay expressed in seconds per vehicle for signalized and all-way stop-controlled intersections. The vehicular delay for the worst movement is reported for side-street stop-controlled intersections.
[3] LOS calculations performed using the *Highway Capacity Manual (HCM) 2010* method. LOS for side street stop-controlled (SSSC) intersections is worst-case movement. Other uncontrolled movements generally operate well with limited delay.
[4] Undesired LOS and corresponding seconds of delay per vehicle are highlighted in **bold.**
* During the peak hours, mauka-bound queues on Dillingham Blvd will spillback from the N King St intersection through the Kaaahi St intersection. This occurs a few times throughout the peak hour and during this time, delays appear longer than the average peak hour delay reported in the table.

The analysis results indicate that 12 study intersections are forecasted to operate at LOS D or better under Near Term (2022) Baseline Conditions. The remaining three (3) study intersections are expected to operate at undesirable LOS E or F for at least one peak hour and include:

7. N King Street / Dillingham Boulevard/Liliha Street – LOS F (PM peak hour)
9. N Vineyard Boulevard / Liliha Street – LOS F and LOS E (AM and PM peak hours, respectively)
14. N Vineyard Boulevard / Aala Street – LOS E (PM peak hour)

As noted previously, some individual turning movements/approaches operate below LOS D even though the overall intersection is operating at a desirable LOS. The majority of the poorly operating movements are left-turn movements. This is attributed by the signal timing allocating more green time to the through movements, which in most cases, will cause the left-turn movements to operate at LOS E or F in at least one of the peak hours.

6.0 NEAR TERM (2022) PLUS PARTIAL BUILDOUT CONDITIONS

This chapter summarizes and presents an analysis of the potential impacts on the roadway system due to projected increases in traffic, including traffic generated by half of the buildout of the project in 2022. The Near Term (2020) Plus Partial Buildout Conditions roadway network is the same network assumed under the baseline scenario, except for the addition of the site driveways that was discussed in Chapter 5. The analysis compares the projected levels of service at each study intersection under future baseline (or "No Project") conditions against the "Plus Partial Buildout" scenario to determine potential Near Term impacts.

6.1 NEAR TERM (2022) PLUS PARTIAL BUILDOUT INTERSECTION LEVEL OF SERVICE

This section presents an analysis of potential future traffic conditions projected for Near Term (2022) Plus Project Conditions. To forecast the peak hour operating conditions at each study intersection, the project trip assignment for Partial Buildout Conditions were superimposed on Near Term (2022) Baseline traffic volumes to yield Near Term (2022) Plus Partial Buildout volumes. **Figure 11** presents the anticipated lane configurations and projected Near Term (2022) Plus Partial Buildout AM and PM peak hour volumes.

Table 7 presents the intersection operating conditions and traffic impacts under the three Near Term (2022) Plus Partial Buildout Conditions scenarios and compares the projected levels of service at each study intersection under Near Term (2022) Plus Partial Buildout Conditions. The corresponding LOS Calculation sheets are included in **Appendix C.**

Source: Fehr & Peers, 2017.

Notes:

[1] SSSC = Side-street stop controlled

[2] Whole intersection weighted average stopped delay expressed in seconds per vehicle for signalized and all-way stop-controlled intersections. The vehicular delay for the worst movement is reported for side-street stop-controlled intersections.

[3] LOS calculations performed using the *Highway Capacity Manual (HCM) 2010* method. LOS for side street stop-controlled (SSSC) intersections is worst-case movement. Other uncontrolled movements generally operate well with limited delay.

[4] Undesired LOS and corresponding seconds of delay per vehicle are highlighted in **bold.** Project impacts highlighted **gray and bold**.

[5] Change in delay from Plus Partial Buildout to Baseline conditions. N/A indicates that the intersection does not exist under Baseline Conditions.

According to the results in **Table 7,** the addition of Partial Buildout trips would cause a total of three (3) significant impacts to study intersections. Under this scenario, the Partial Buildout project would contribute to cumulative impacts (i.e. exacerbating baseline LOS E or F operations) during one or both peak hours at the following three (3) study intersections:

7. N King Street / Dillingham Boulevard/Liliha Street – LOS E and F (AM and PM peak hours, respectively)
9. N Vineyard Boulevard / Liliha Street – LOS F (AM and PM peak hours)
14. N Vineyard Boulevard / Aala Street – LOS E (PM peak hour)

All project driveways are anticipated to operate at desirable levels under Near Term (2022) Plus Partial Buildout Conditions.

7.0 LONG-TERM (2028) BASELINE CONDITIONS

This chapter summarizes and presents the results of the operations analysis under Long-Term (2028) Conditions without the project's Full Buildout travel demand characteristics.

7.1 LONG-TERM (2028) TRAFFIC ESTIMATES

The following section summarizes the growth assumptions used to estimate the amount of traffic that would be adding to existing intersection volumes to develop volume estimates for Long-Term (2028) Conditions.

7.1.1 AREAWIDE OR AMBIENT TRAFFIC GROWTH

Similar to the Near Term (2022) baseline forecasts, a growth factor was individually applied to the traffic of each intersections approach to account for future regional growth. Since this scenario would include the future rail in operation, the *Honolulu High-Capacity Transit Corridor Project (HHCTP), Final Environmental Impact Statement* (June 2010) was reviewed to calculate the traffic forecasts. According to that study and other transportation studies in the study area, the traffic volumes on major roadways are anticipated to increase approximately 0.5 percent per year when the future rail is in full operation. This growth rate is considered reasonable given the urban and dense nature of the adjacent areas and surrounding neighborhoods. Additionally, while the future rail is expected to address future transportation demand and capacity needs, it is not expected to significantly reduce traffic volumes on major roadways near the rail line as the extra capacity on the roadway would be backfilled with the increase of traffic generated by planned developments around the region. Therefore, a 0.5 percent growth factor was applied to the existing traffic volumes collected in August 2016. The growth rate was compounded over a 12-year timeframe (2016 to 2028) during full buildout of the proposed project.

7.1.2 APPROVED PROJECTS

Similar to the Near Term (2022) Baseline traffic forecasts, only one cumulative project, the Liliha Civic Center project, was identified in the immediate study area by year 2028, and that future development was subsequently added to the cumulative base traffic projections for 2028.

The proposed Liliha Civic Center is estimated to generate approximately a total 2,118 daily vehicle trips, 323 AM peak hour vehicle trips (284 inbound; 39 outbound), and 290 PM peak hour vehicle trips (49 inbound, 241 outbound). The Liliha Civic Center trips were then assigned to the roadway network and added to the ambient 2028 background volume.

Mayor Wright Housing Redevelopment –Multimodal Transportation Assessment
January 2018

7.1.3 LONG-TERM (2028) BASELINE STREET SYSTEM IMPROVEMENTS

Based on a review of public documents, including O`ahu's *Transportation Improvement Program for Fiscal Years 2015-2018* and the *O`ahu Regional Transportation Plan 2040*, there are no anticipated roadway improvements or transportation system changes that are projected to occur between 2016 and 2028 in the immediate vicinity of the project site and more specifically at the study intersections. Therefore, the Long-Term (2028) Baseline traffic network is assumed to remain the same as Existing Conditions.

Figure 12 shows the traffic volumes and lane configurations under Long-Term (2028) Baseline Conditions

7.2 LONG-TERM (2028) BASELINE LEVELS OF SERVICE

Levels of service calculations were conducted to evaluate the operating levels of the study intersections under Long-Term (2028) Baseline Conditions based on the projected growth in traffic and the anticipated roadway improvements. The results of the LOS analysis for the study intersections under Long-Term (2028) Baseline Conditions are presented in **Table 8.** The corresponding LOS Calculation sheets are included in **Appendix C.**

Notes:
[1] SSSC = Side-street stop controlled
[2] Whole intersection weighted average stopped delay expressed in seconds per vehicle for signalized and all-way stop-controlled intersections. The vehicular delay for the worst movement is reported for side-street stop-controlled intersections.
[3] LOS calculations performed using the *Highway Capacity Manual (HCM) 2010* method. LOS for side street stop-controlled (SSSC) intersections is worst-case movement. Other uncontrolled movements generally operate well with limited delay.
[4] Undesired LOS and corresponding seconds of delay per vehicle are highlighted in **bold.**
* During the peak hours, mauka-bound queues on Dillingham Blvd will spillback from the N King St intersection through the Kaaahi St intersection. This occurs a few times throughout the peak hour and during this time, delays appear longer than the average peak hour delay reported in the table.

The analysis results indicate that 12 study intersections are forecasted to operate at LOS D or better under Long-Term (2028) Baseline Conditions. The remaining three (3) study intersections are expected to operate at undesirable LOS E or F for at least one peak hour:

7. N King Street / Dillingham Boulevard/Liliha Street – LOS E and F (AM and PM peak hours, respectively)
9. N Vineyard Boulevard / Liliha Street – LOS F (AM and PM peak hours)
14. N Vineyard Boulevard / Aala Street – LOS E (AM and PM peak hours)

Additionally, since these intersections already operate at undesirable operations without the project, any development of the project (e.g. phase 1, partial buildout, full buildout, etc.) would result in an impact at these three intersections.

Similar to the existing conditions summary, it should be noted that some individual turning movements/approaches operate below LOS D, even though the overall intersection is operating at a desirable LOS.

8.0 LONG-TERM (2028) PLUS FULL BUILDOUT CONDITIONS

This chapter summarizes and presents an analysis of the potential impacts on the roadway system due to projected increases in traffic, including traffic generated by full buildout of the project in 2028. The Long-Term (2028) Plus Full Buildout Conditions roadway network is the same network assumed under the baseline scenario, except for the addition of the site driveways that was discussed in Chapter 5. The analysis compares the projected levels of service at each study intersection under future baseline (or "No Project") conditions against the "Plus Full Buildout" scenario to determine potential Long-Term (2028) impacts.

8.1 LONG-TERM (2028) PLUS FULL BUILDOUT INTERSECTION LEVEL OF SERVICE

This section presents an analysis of potential future traffic conditions projected for Long-Term (2028) Plus Full Buildout Conditions. To forecast the peak hour operating conditions at each study intersection, the project trip assignment for Full Buildout Conditions were superimposed on Long-Term (2028) Baseline traffic volumes to yield Long-Term (2028) Plus Full Buildout volumes. **Figure 13** presents the anticipated lane configurations and projected Long-Term (2028) Plus Full Buildout AM and PM peak hour volumes.

Table 9 presents the intersection operating conditions and traffic impacts under Long-Term (2028) Plus Full Buildout Conditions scenarios and compares the projected levels of service at each study intersection under Long-Term (2028) Plus Full Buildout Conditions. The corresponding LOS Calculation sheets are included in **Appendix D.**

[2] Whole intersection weighted average stopped delay expressed in seconds per vehicle for signalized and all-way stop-controlled intersections. The vehicular delay for the worst movement is reported for side-street stop-controlled intersections.
[3] LOS calculations performed using the *Highway Capacity Manual (HCM) 2010* method. LOS for side street stop-controlled (SSSC) intersections is worst-case movement. Other uncontrolled movements generally operate well with limited delay.
[4] Undesired LOS and corresponding seconds of delay per vehicle are highlighted in **bold.** Project impacts highlighted **gray and bold**.
[5] Change in delay from Full Partial Buildout to Baseline conditions. N/A indicates that the intersection does not exist under Baseline Conditions.
* During the peak hours, mauka-bound queues on Dillingham Blvd will spillback from the N King St intersection through the Kaaahi St intersection. This occurs a few times throughout the peak hour and during this time, delays appear longer than the average peak hour delay reported in the table.

According to the results in **Table 9,** the addition of Full Buildout trips would cause of total of three (3) significant impacts to study intersections. Under this scenario, the Full Buildout project would contribute to cumulative impacts (i.e. exacerbating baseline LOS E or F operations) during one or both peak hours at the following three (3) study intersections:

7. N King Street / Dillingham Boulevard/Liliha Street – LOS E and F (AM and PM peak hours, respectively)
9. N Vineyard Boulevard / Liliha Street – LOS F (AM and PM peak hours)
14. N Vineyard Boulevard / Aala Street – LOS E (PM peak hour)

All project driveways are anticipated to operate at desirable levels under Long-Term (2028) Plus Full Buildout conditions, with the exception of the N Vineyard Blvd right-in-right-out project driveway (intersection 16),

which is anticipated to operate at LOS E during the AM peak hour. The mauka-bound right turn from the project site to Vineyard Boulevard is anticipated to experience an average of 39 seconds of vehicle delay during the peak hour, which is only four seconds above the LOS E threshold (i.e. 35 seconds), while most of the traffic traveling through that intersection on N Vineyard Boulevard is expected to experience minimal to no delay. Furthermore, the upstream N Vineyard Boulevard/Pua Lane traffic signal would provide gaps in traffic on Vineyard Boulevard that would allow vehicles leaving the project driveway to make the right-turn onto Vineyard Boulevard. Therefore, intersection capacity enhancements such as a traffic signal or lane additions are not considered necessary to substantially improve intersection operations.

8.2 IWILEI STATION SENSITIVITY ANALYSIS

Due to current funding concerns, the future Honolulu Rail Transit project is currently being reevaluated in terms of the project scale. The *HART Recovery Plan* dated April 2017 describes the history of the project, what influenced the increased project costs, and the schedule delays that have occurred. The Federal Transit Administration directed HART to evaluate two options for the project:

- Plan A – Complete the original proposed 20-miles of rail with 21 stations to Ala Moana
- Plan B – "Build to budget". A less expensive project that would end the line near Aloha Tower and eliminate seven (7) stations in Downtown along the route.

Plan B would keep the Middle Street station and remove the Kalihi, Kapalama, Iwilei, and Chinatown stations, and ultimately end in Downtown. Since the trip generation estimates for Long-Term (2028) Full Buildout conditions assumes the full completion of the rail project, a sensitivity analysis was conducted to determine if there would be any additional impacts to study facilities without the Iwilei rail station in operation.

The transit reduction for project buildout in 2028 (i.e., 30 percent with the Iwilei station) was reduced to account for no Iwilei rail station, which would be a 25 percent transit reduction and the same as Near Term (2022) Partial Buildout conditions. **Table 10** compares the net new vehicle trips without and with Iwilei rail station under Year 2028 Plus Full Buildout conditions.

TABLE 10: LONG-TERM (2028) PLUS FULL BUILDOUT TRIP GENERATION COMPARISON

Long-Term (2028) Plus Full Buildout Rail Scenario	Daily	AM Peak Hour			PM Peak Hour		
		In	Out	Total	In	Out	Total
PROPOSED PROJECT'S NET NEW VEHICLE TRIPS							
With Iwilei Rail Station (30% transit reduction)	10,085	111	467	578	590	369	959
No Iwilei Rail Station (25% transit reduction)	11,019	126	515	641	641	402	1,043
TRIP DIFFERENCE	**934**	**15**	**48**	**63**	**51**	**33**	**84**
PERCENT DIFFERENCE	**9%**	**11%**	**10%**	**14%**	**9%**	**9%**	**9%**

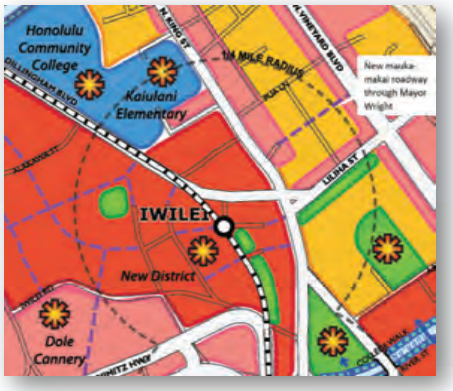
Source: Fehr & Peers, 2017

As shown in Table 10, without the Iwilei rail station, the project would generate a total of 11,019 net new vehicle daily trips, 641 net new vehicle trips in the AM peak hour, and 1,043 net new vehicle trips in the PM peak hour. The trip estimates without the Iwilei station in 2028 would be approximately 9 percent higher for the daily trips, 14 percent higher in the AM peak hour, and 9 percent higher in the PM peak hour.

Based on the sensitivity operations analysis, if there were no Iwilei rail station, the project would impact the same three study intersections (Int 7. N King Street/Dillingham Boulevard/Liliha Street, Int 9. N Vineyard Boulevard/Liliha Street and Int 14. N Vineyard Boulevard/Aala Street) as the scenario with the rail station, and there would be no additional project impacts to other study intersections. The delay increase at the study intersections would be minimal as the increase in traffic volume would be distributed amongst multiple project driveways and study intersections.

Mayor Wright Housing Redevelopment –Multimodal Transportation Assessment
January 2018

8.3 MAUKA-MAKAI PROPOSED ROADWAY



In the *Downtown Neighborhood Transit-Oriented Development (TOD) Plan* (August 2017), a new mauka-makai roadway was proposed that would transverse through the project site and connect Vineyard Boulevard to Desha Lane. The image to the left shows the proposed roadway alignment in purple. The proposed roadway would essentially bisect the project site and its intended purpose is to increase vehicular, pedestrian, and bicycle access to the project site and to decrease the block lengths fronting the site.

While this roadway would theoretically increase connectivity in the area, it is not expected to create a significant change in travel patterns or substantially increase access in this area. Parallel and adjacent facilities, such as Palama Street, Pua Lane, and Liliha Street already provide similar connections between Vineyard Boulevard and N King Street. Pua Lane, which is the most similar to the proposed connection in terms of character and vehicle capacity, has some surplus capacity under existing conditions and already serves vehicles attempting to avoid the Liliha Street congestion. With the project in place, Pua Lane will include two vehicle access points to the site and will adequately serve projected site traffic volumes at buildout (see Chapter 10 for additional discussion). Additionally, the project proposes to include a new vehicular access point on Vineyard Boulevard that would accomplish the goals of the proposed connection from the TOD plan cited above. Based on the existing surplus capacity on Pua Lane and the inclusion of the mauka section of the TOD connection, it is anticipated that the proposed new roadway in its entirety would primarily serve project-generated trips and not external traffic volumes. Accordingly, an assessment was conducted of the project driveways with the new mauka-makai roadway connection to determine how many project trips would shift to the new N King Street / Desha Lane – Project driveway intersection.

The mauka end of the new roadway would connect at the same location on N Vineyard Boulevard as the proposed right-in-right-out driveway, so the volumes at that intersection would essentially stay the same. To access N King Street, project generated vehicles could use the Desha Lane project driveway instead of turning to and from Pua Lane. For vehicles exiting the site, it is not expected that there would be a

substantial shift to the Desha Lane driveway, as that intersection would be side-street-stop controlled and turning onto N King Street during the peak periods could be difficult due to the high traffic volumes on that corridor during the peak periods. While a signal could theoretically be provided at Desha Lane on King Street, it is only 300 feet from the Dillingham Boulevard/Liliha Street intersection, and the minimum desired signal spacing on a major arterial roadway is typically 400 feet or more.

In general, the N King Street/Pua Lane would experience the largest decrease (approximately 100 vehicle total under Buildout conditions) with the new extension to Desha Lane, while the Liliha Street/Kukui Street intersection would only experience a decrease of approximately 25 vehicles total at that intersection during the peak hours. **Appendix D** shows the reassignment of project trips at the project driveways and adjacent study intersections under Partial Buildout and Buildout conditions. Based on this assessment, the proposed mauka-makai roadway connecting Desha Lane to Vineyard Boulevard would not provide a substantive benefit from an overall traffic circulation perspective. The existing segment of Desha Lane is relatively narrow and functions more like an alley, so if a connection to the project site would exist, it could function as a one-way inbound or outbound vehicle access; however, as described previously, the Desha Lane driveway is not needed due to the ample capacity at the other site driveways and adjacent intersections. Lastly, the site plan does not appear to preclude this connection as a pedestrian/bicycle only facility or as a full-multi-modal connection (should it be desired in the future).

Mayor Wright Housing Redevelopment –Multimodal Transportation Assessment
January 2018

9.0 POTENTIAL TRAFFIC IMPROVEMENTS

Potential traffic improvements were identified to increase the capacity and/or efficiency of the roadway system at the locations where the addition of project-related traffic would contribute to poor operating conditions. The emphasis was to identify physical and/or operational improvements that could be implemented within the existing or planned roadway rights-of-way and determine if improvements would be ultimately feasible.

The potential measures to address the identified traffic impacts are described in this chapter. Each of the initially identified impacts would be reduced such that future plus project operations would be better than baseline conditions. Consultations with HDOT and DPP were conducted to discuss their concerns and goals in balancing operations and safety for travel all modes in the study area, particularly at the impacted intersections.

The full range of improvements that address both project-related and/or cumulative traffic impacts are discussed in detail below.

INTERSECTION 7: N KING STREET / DILLINGHAM BOULEVARD/LILIHA STREET (CUMULATIVE IMPACT)

Significantly impacted with any redevelopment of Mayor Wright (i.e. Partial Buildout and Full Buildout)

This intersection operates at F in the PM peak hours under Near Term (2022) and Year (2028) Baseline Conditions. The addition of project trips (Partial Buildout and Full Buildout) would exacerbate LOS F operations under all two project scenarios (as well as in the "No Iwilei Rail Station" scenario).

Theoretical improvement:

- Restripe the N King Street ewa-bound through/left lane to an exclusive left-turn lane.
- Restripe the N King Street ewa-bound through/right lane to an exclusive through lane.
- Add a separate ewa-bound right-turn lane with a turn pocket of approximately 220 feet on N King Street.

Implementing the N King Street ewa-bound lane restriping and separate right-turn lane would increase vehicle capacity for the ewa-bound approach at this intersection. However, due to the unique lane configurations, signal timings, and high volumes on the other approaches, the improvements on the ewa-bound approach would provide minimal benefit to the overall intersection operation as the other major approaches (i.e. mauka-bound Dillingham Boulevard) would continue to operate at significant levels of delay. With the described improvements, the intersection delay would decrease to 100.4 in the PM peak hour under Long-Term (2028) Plus Full Buildout Conditions, which is only 0.5 seconds better than baseline conditions.

Vehicle capacity enhancements at this intersection are considered limited due to the right-of-way constraints and high traffic volumes on all approaches. The N King Street ewa-bound improvements are not recommended as it would potentially cause potential secondary environmental impacts and require right-of-way acquisitions along the N King Street mauka property (to add a separate right-turn lane) and would only provide minimal delay reductions to the overall intersection. Substantially reducing delay at this intersection with the existing and projected high volumes on all approaches would essentially require widening all approaches to provide additional through lanes and separate turn lanes. However, widening these roadways is not considered feasible due to: the right-of-way constraints and secondary adverse impacts (i.e. to pedestrian/bicyclists).

Heavy congestion on these roadways is primarily attributed to regional traffic demand, and widening these roadways is beyond the scope of a single development project. Additional improvements including new street connections within the greater Kalihi area would help reduce demand at this intersection and would compensate for several of the prohibited turning movements at this location.

INTERSECTION 9: N VINEYARD BOULEVARD / LILIHA STREET (CUMULATIVE IMPACT)

Significantly impacted with any redevelopment of Mayor Wright (i.e. Partial Buildout and Full Buildout)

This intersection operates at E or F in the AM and PM peak hours under Near Term (2022) and Year (2028) Baseline Conditions. The addition of project trips (Partial Buildout and Full Buildout) would exacerbate LOS operations under all two project scenarios (as well as in the "No Iwilei Rail Station" scenario).

Recommended improvement: Construct a second Diamond Head-bound left-turn lane on N Vineyard Boulevard to accommodate the future vehicle demand. This would require taking four (4) feet of the existing median, reducing the Diamond Head-bound left-turn lanes to 10 feet each, the two through lanes to 11 feet, and the through/right-turn to 13 feet (to accommodate right-turning buses).

Full Buildout would add 53 and 63 vehicle trips in the AM and PM peak hours, respectively, to the Diamond Head-bound left-turn at the N Vineyard Boulevard/Liliha Street intersection. The addition of project traffic exacerbates the poor mauka-bound left movement, and exacerbates the overall LOS F intersection operations. Therefore, a second mauka-bound left turn on N Vineyard Boulevard is recommended to accommodate the additional vehicle demand and ameliorate vehicle delay at this intersection to better than Baseline Conditions in the AM and PM peak hours. This improvement is considered feasible from a right-of way perspective and would still allow for an ADA-compliant pedestrian refuge area in the median island.

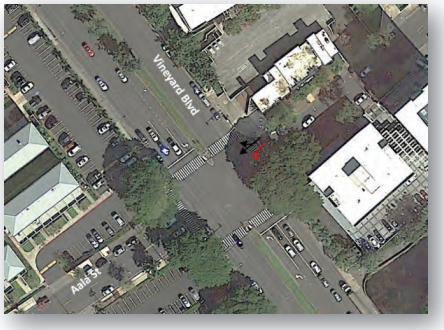
INTERSECTION 14: N VINEYARD BOULEVARD / AALA STREET (CUMULATIVE IMPACT)

Significantly impacted with any redevelopment of Mayor Wright (i.e. Partial Buildout and Full Buildout)

This intersection operates at LOS E in the PM peak hour under Near Term (2022) Baseline Conditions, and LOS E in the AM and PM peak hours under Long-Term (2028) Baseline Conditions. The addition of project trips (Partial Buildout and Full Buildout) would exacerbate LOS during one or both peak hours.

Theoretical improvement: Restripe makai-bound Aala Street to provide a separate left-turn lane and a through/right-turn lane.

The existing roadway width is sufficient to add a separate left-turn lane and a through/right-turn lane for the makai-bound approach on Aala Street. This would require removing approximately five (5) parking stalls on Aala Street (three on the ewa side and two on the Diamond Head side) to accommodate the new lanes. This modification would improve operations to LOS D in the PM hour under Long-Term (2028) Plus Full Buildout conditions. TRB staff will balance the need for on-street parking with the slight exceedance of intersection operations by 4.5 seconds over the LOS D threshold.



9.1 POTENTIAL TRAVEL DEMAND MANAGEMENT STRATEGIES

Besides simply expanding roadways to accommodate additional vehicle demand, the proposed project could implement some transportation demand management (TDM) strategies to reduce overall site-generated traffic volumes. Application of TDM strategies that could lead to vehicle trip reduction, use of alternative modes, and better traffic management at the site could include, but are not limited to:

- Implementation of a detailed TDM program for residents and retail employees, which would be managed by a TDM coordinator who would organized and coordinate monitoring efforts, parking and traffic management plans, and the implementation of TDM and recommendations and modifications.
- Provision of a transportation kiosk and on-line portal for information on ride-sharing, transit, bicycling, walking, and options for accessing the site without using a private automobile.
- Partial or fully subsidized transit passes for on-site employees and/or residents.
- Provision of bicycle racks adjacent to retail development, at communal open space, and residential buildings within the project site.
- Unbundling parking from apartment units to reduce rental costs for some units and to incentivize use of non-auto travel modes.

Prior to the implementation of any TDM measures, the project sponsor will need to coordinate with the City & County of Honolulu and/or transit service providers.

10.0 SITE ACCESS, CIRCULATION, AND PARKING

This chapter includes a review of the site access and on-site circulation for vehicles, bicyclists and pedestrians. An evaluation of off-site active and transit travel modes is presented in Chapter 11.

10.1 SITE ACCESS

As described in Chapter 4.3: *Proposed Project Roadway Modifications,* vehicle access to the site will be provided by four driveways: one full-access at Liliha Street/Kukui Street, a right-in-right-out driveway on N Vineyard Boulevard, and two full-access driveways on Pua Lane. Each driveway would include one inbound land and one outbound lane.

Based on the operations analysis, all site driveways are anticipated to operate at desirable levels for both AM and PM peak hours under Partial and Full Buildout conditions. Therefore, the four site driveways are adequate to serve the project demand. One potential site issue is a sight-distance issue at the Pua Lane driveways. Pua Lane currently provides on-street parallel parking on both sides of the roadway. The adjacent parked cars on either side of the proposed main driveway could potentially block an outbound driver's line of sight. Therefore, to improve visibility for driver's exiting the project site, it is recommended that the curbs be painted red at least one car length (i.e., a minimum of 20 feet) on each side of the driveway.

Additionally, due to the signals on N King Street and Vineyard Boulevard, makai-bound or mauka-bound vehicle queues on Pua Lane could potentially extend back and block the site driveway for vehicles entering or existing the project site. A "Keep Clear" designation should be striped on Pua Lane to require gaps in the queue and allow left-turn access into and out of the project site during peak periods.

The site plan also shows an access on the makai side of the site on N King Street. This driveway was initially intended for a vehicle access, however, due to the multiple conflicts at that location, it was not recommended and ultimately changed to a pedestrian only access. The vehicle conflicts at the N King Street access includes:

- An ewa-bound bus stop is located approximately 50 feet Diamond Head of the site access. When a bus is stopped loading and unloading a passengers, the driver of a vehicle turning out of the project driveway would not be able to see oncoming vehicles.
- N King Street merges from three ewa-bound lanes to two approximately 50 feet Diamond Head of the site access, and drivers on the street would be focused on merging operations instead of focusing on vehicles entering and exiting the site access.
- Similarly, buses exiting the stop area would conflict with vehicles trying to enter the site access.

Due to these factors, adding a new vehicle access on N King Street where there are already multiple conflicts occurring could result in safety issues for all users including pedestrians on the sidewalk. Furthermore, as discussed previously, the site is already adequately served by the four vehicle driveways, so the N King Street driveway is not be needed to serve the project's vehicle demand.

Pedestrian/bicycle and vehicle conflicts could potentially occur at project driveways, when a car is exiting and pedestrians/bicyclists using the sidewalk that cross the driveway. All of the vehicle access points on public streets are expected to be designed with appropriate signing and striping to alert all users of potential conflicts between bicyclists/pedestrians and vehicles. Furthermore, the driveways should be designed and be constructed so that adequate sight distance is provided for drivers of vehicles exiting and entering the project site.

Due to the new driveway changes on Pua Lane and the addition of project traffic, it is recommended that traffic calming enhancements and parking improvements be implemented to improve the safety and operations of the roadway. The following improvements are recommend on Pua Lane:

- *Consider installation of a Neighborhood Traffic Circle (NTC) at Pua Lane/Kanoa St/Project Makai Driveway* – While there are already speed humps on Pua Lane to help moderate vehicle speeds, a neighborhood traffic circle (NTC) at this intersection would further moderate vehicle speeds on the roadway and reduce the severity of potential collisions. The NTC would also reduce stopping on Kanoa Street and the project's makai driveway. It should be noted that an NTC would likely require elimination of several parking spaces on both sides of Pua Lane, mauka and makai of the NTC.
- *Install Metered Parking on Pua Lane* – This modification would promote frequent turnover of parked vehicles on Pua Lane, and would have to be implemented by the City & County of Honolulu Department of Transportation Services (DTS). The metered parking could be enforced only during typical daytime hours (e.g. 8 AM to 6 PM), so that in the evening, area residents or guests could park on Pua Lane for longer periods of time.
- *Install bicycle sharrows on Pua Lane and Kanoa Street* – this would highlight the presence of bicyclists on this street and inform motorists traveling on Pua Lane to share the roadway. This improvement would provide a visual connection to the planned bike facilities on N King Street that are being planned as part of the City & County's Complete Streets project.
- *Install curb extensions on the makai corners of the N Vineyard Boulevard/Pua Lane intersection* - this would increase pedestrian visibility through improved sight lines and also increase the pedestrian waiting space. Additionally, curb extensions would decrease the walking distance for pedestrians crossing Pua Lane. Given that this is improvement is on a State facility, coordination with DOT is required to implement this improvement.

Furthermore, a Traffic Management Plan (TMP) will be completed later in the project application process to analyze and address any potential construction impacts to the surrounding roadway system.

Mayor Wright Housing Redevelopment –Multimodal Transportation Assessment
January 2018

10.2 ON-SITE VEHICLE CIRCULATION AND PARKING

The site plan includes two-way drive aisles with no "dead-end" aisles. None of the aisles/internal roadways are excessively long to where vehicle speeds on-site are expected to be excessive.

The distribution of the on-site parking supply locations have not yet been finalized, but parking is expected to be provided in structures incorporated within several of the residential building areas. The number of parking spaces on the project site will be consistent with the parking requirements identified in the recently approved *Downtown Neighborhood Transit-Oriented Development (TOD) Plan* (August 2017).

As the site plan refinements proceed, it is recommended that no parking spaces be provided within 150 feet of the project site driveways. For spaces near project driveways, a vehicle might have trouble exiting the space if there is a vehicle queue at the driveway waiting to exit the site. Additionally, if a vehicle is trying to enter or exit a parking space near a driveway, it could potentially create a conflict point for vehicles entering the site and vehicles parking their car. A vehicle may need to wait for the other vehicle parking, which could potentially create a vehicle queue that would spill back into the adjacent external roadway (i.e. Liliha Street, N Vineyard Boulevard, or Pua Lane).

There are two options for residential parking: (1) designated parking spaces per dwelling unit and a separate supply for retail, or (2) unbundled parking, which separates the cost to rent a parking space from the cost to rent an residential unit. For the designated parking spaces option, it provides limited opportunity for shared parking between the retail and residential uses of the project since the parking spaces would be reserved for a specific residential unit and would need to be accessible at all times. For the unbundled parking option, shared parking is more viable, assuming that not every unit rents a parking space, which results in excess parking that could be shared with the retail and require a lower parking supply for that use. As noted under Section 9.1, unbundling parking from the residential units would allow the supply to be better managed and provide financial incentives (i.e., lower rent) for residents to not own and park a vehicle at the project site.

10.3 ON-SITE PEDESTRIAN AND BICYCLE CIRCULATION

The site plan shows marked crosswalks on all the internal intersections and at several midblock locations. As stated in the previous section, a pedestrian/bicycle access would be provided on the makai side of the site on N King Street just ewa of Liliha Street. Pedestrian and vehicle conflicts could potentially occur at project driveways, particularly at unsignalized driveways when a car is exiting and pedestrians using the sidewalk that crosses the driveway. To enhance safety for pedestrians, it is recommended that signage be installed at all of the unsignalized driveways to alert motorists of potential pedestrian conflicts. Signs would

typically include a "STOP" sign on each driveway approach, as well as a sign indicating the presence of pedestrians.

People on bicycles are also expected to access the project site. No separate paths need to be incorporated within the site, since bicyclists will be expected to share the internal roadways with vehicles. Volumes and speeds are expected to be relatively low creating a "bicycle boulevard" environment with the site. However, secure bike parking should be provided at various locations throughout the site for both residents and visitors. At a minimum, this would include bike racks at several key locations to encourage the use of non-automobile travel. The number of bike parking spaces will be consistent with the bike parking requirements specified in the approved *Downtown Neighborhood TOD Plan*. Ideally, for convenience, each building should provide a proportional number of bike parking spaces to units either in their garage or close to building entrances.

Furthermore, the project site should accommodate space along the project site frontage for up to two bike share stations. Ideally, one would be located on the makai-Diamond Head side of the site near the N King Street / Dillingham Boulevard – Liliha Street intersection, and the second station could be located near the Vineyard Boulevard/Lililha Street intersection. The final locations for bike storage facilities and bike share stations will be determined by the project team in consultation with DPP staff.

Mayor Wright Housing Redevelopment –Multimodal Transportation Assessment
January 2018

11.0 MULTI-MODAL ASSESSMENT

Consistent with State of Hawaii and City & County of Honolulu policies on Complete Streets, this chapter addresses any potential project impacts on all non-automobile modes of transportation, including existing and planned pedestrian, bicycle, and transit facilities. Based on the review of the site plan illustrated on **Figure 2** and the project description, the project would not cause any significant impact to the overall existing and planned external multi-modal transportation system in the Kalihi area. The project design will adhere to the policies and principles outlined in the City & County of Honolulu's Ordinance relating to Complete Streets (2012) as it includes features to enhance mobility and access for all its residents and other users using all modes of transportation. It is further recommended that as the site plan is further refined, the Developer should consult with the State and City & County of Honolulu to design the internal roadway networks, cross sections, and access driveways in a manner that embraces the principles of Complete Streets and corresponds with the adjacent Liliha and Urban Core Complete Streets projects.

11.1.1 HONOLULU COMPLETE STREETS PROJECTS

The City & County of Honolulu is working to implement Complete Streets on several areas on the island of O`ahu. There are currently eight (8) complete streets project on O`ahu, with the Nuuanu/Liliha and the Urban Core Complete Streets projects immediately adjacent to the Mayor Wright project.

The Nuuanu/Liliha Complete Streets project includes Nuuanu Avenue between School Street and Pali Highway and Liliha Street between School Street and Wyllie Street. The Urban Core Complete Streets project is looking at opportunities for integrating complete streets across approximately 16 miles of roadways that includes portions of King Street, Kapiolani Boulevard, Piikoi Street, Pensacola Street, Punch Bowl Street, Ward Avenue, Kamakee Street and others. The Urban Core Complete Streets project starts at the intersection on N King Street / Dillingham Boulevard – Liliha Street and provides multimodal improvements on N King Street that extend in the Diamond Head bound direction.

The complete streets projects includes, but not limited to, reducing vehicle capacity on the roadway to implement protected bike lanes in either one or both directions. Given the close proximity of the Liliha and Urban Core Complete Streets projects to the Mayor Wright project, the Developer should coordinate with the City & County to ensure that the planned project improvements correlates with the on-going Complete Streets plans.

11.1.2 PEDESTRIAN NETWORK

The proposed project follows new urbanist design principles that include an emphasis on walkability and connectivity through the pedestrian networks within the project site and connecting to the rest of the Kalihi

community. The site plan does not currently provide details on the external sidewalk widths, but it is recommended that the existing sidewalks adjacent to the project site are enhanced and widened where feasible with the project.

Pedestrian Safety Enhancements

The project's study area currently serves a substantial amount of pedestrian traffic each day due to the nearby schools, retail centers, residential areas, and available transit. This is volume is anticipated to grow in the future with the future Iwilei rail station and the planned development in the Kalihi community. However, there are some locations immediately adjacent to the site that currently have deficient pedestrian facilities.

The two major adjacent intersections to the project site (N King Street/Dillingham Boulevard/Liliha Street and N Vineyard Boulevard/Liliha Street) currently serve high pedestrian traffic and would serve a large portion of the project's pedestrian traffic, though these intersections could be enhanced from a pedestrian safety perspective.

The following enhancements are recommended to improve safety and serve existing and future pedestrian demand:

N King Street/Dillingham Boulevard/Liliha Street

- *Install "Leading Pedestrian Intervals" (LPIs) at all crosswalks.* LPIs give pedestrians a few seconds (typically 3 to 7 seconds) head start when entering an intersection with the corresponding green signal. According to the National Association of City Transportation Officials (NACTO), LPIs could reduce pedestrian-vehicle collision as much as 60 percent at treated intersections. This improvement would increase the visibility of pedestrians crossing as they would enter the intersection before the vehicle is given the green light to turn left or right. LPIs are a relatively low cost improvement as it would only require adjustments to the existing signals.

- *Relocate the existing signal box and signal pole on the mauka-ewa corner of N King Street/Liliha Street to behind (i.e. ewa side) of the crosswalk.* The existing location of the signal box and the signal pole creates a visibility issue for pedestrians waiting to cross the ewa crosswalk in the mauka-ewa corner and for drivers in vehicles turning right from Liliha Street onto N. King Street. Moving the signal box and pole behind the crosswalk (in the ewa direction) removes the obstruction and increases the visibility of pedestrians waiting to cross.

- *Straighten the makai crosswalk across Dillingham Boulevard and move the vehicle stop bar approximately 15-feet back.* This crosswalk is currently skewed to connect closer to the center of the makai-Diamond head corner; however, since no crosswalk is provided on the other side of this corner (i.e. across N King Street), the makai crosswalk across Dillingham Boulevard could be

Mayor Wright Housing Redevelopment –Multimodal Transportation Assessment
January 2018

pushed back further from the center of the corner so that it aligns straight across the intersection. Doing this would shorten the crosswalk distance for pedestrians by approximately 10 feet (from 80 feet to 70 feet). This would require restriping the crosswalk and lanes, which is relatively a low cost improvement.

Additionally, the intersection currently does not provide a crosswalk on the Diamond Head leg of the intersection across N King Street due to the heavy conflicting mauka-bound right-turn movement; thus, an analysis was conducted to determine how the addition of the missing Diamond Head crosswalk would affect traffic operations at this intersection. Due to the existing lane configuration and signal phasing at this intersection, installation of a crosswalk on the Diamond Head leg would require that the mauka-bound right-turn movement on Dillingham Boulevard be protected and run separately from the through phase. The new crosswalk would run concurrently with the mauka-bound through phase. This phasing would be similar to the makai-bound approach on Liliha Street, where the left-turn is a protected phase, so if there is a left-turn vehicle in the shared left-through lane, it would block through traffic till the signal turns green for the left-turn movement. This type of signal phasing would accommodate a Diamond Head crosswalk and not cause any conflicts with the mauka-bound right-turn movement and pedestrians using the crosswalk; however, due to the inefficient use of green time from the signal phasing on all other approaches, the intersection's average vehicle delay would increase approximately 40 percent with inclusion of the missing crosswalk. To install the Diamond Head sidewalk, additional lanes on Dillingham Boulevard would be required to serve the vehicle demand and reduce the intersection's delay. Consequently, a crosswalk on the Diamond Head leg of the N King Street/Dillingham Boulevard/Liliha Street is not recommended due to the adverse effects to the vehicle operations at this intersection.

N Vineyard Boulevard/Liliha Street

- *Install "Leading Pedestrian Intervals" (LPIs) at all crosswalks.* See benefit above.

- *Relocate all pedestrian push buttons so that they are within 10 feet from the curb ramp.* This intersection currently only provides one push button in each corner. To ensure that pedestrians can easily activate a pedestrian call for their crosswalk, a push-button should be provided within in close proximity to the curb ramp.

A curb extension was also evaluated at the makai-ewa corner of this intersection since there is an existing sight visibility issue with pedestrians crossing the makai crosswalk across Liliha Street being blocked by the existing building (similar to the one described above in the mauka-ewa corner). A curb extension would increase pedestrian visibility through improved sight lines and also increase the pedestrian waiting space. However, the N Vineyard Boulevard Diamond Head-bound right-turn at that corner currently serves multiple bus routes, so a turning template analysis was conducted to determine if a bus (both a standard 40 foot and an articulated 60-foot bus) would be able to make a right-turn without encroaching into the inside makai-bound lane on Liliha Street. The analysis showed that with a curb extension on this corner, a

bus would need to encroach into the adjacent travel lane to make the turn. Consequently, this improvement was not recommended, as it could interfere with vehicle flow in the Liliha Street corridor.

Figure 14 and 15 shows the recommend pedestrian enhancements at the N King Street/Dillingham Boulevard/Liliha Street and N Vineyard Boulevard/Liliha Street intersections, respectively.

Given the close proximity to the future Iwilei rail station and the anticipated high project rail ridership, it is recommended that the Developer participate (but not be held fully responsible) in the construction of a wide and complete sidewalk on Liliha Street and Dillingham Boulevard from the project site to Kaaahi Street, where the future Iwilei rail station would be located. The sidewalk is recommended to be a minimum of eight (8) feet wide and free of obstructions (e.g. signal poles, signal boxes, trees, furniture, etc.) to the extent feasible. Additionally, it is recommended that a stripped crosswalk be installed on the Dillingham Boulevard makai leg at the Kaaahi Street intersection to increase pedestrian connectivity. Along the project frontage on Liliha Street, the sidewalk could be constructed to provide an eight foot sidewalk and eight foot parkway/amenity zone.

Furthermore, the sidewalk on N King Street Diamond Head of Pua Lane, adjacent to the Shell Gas Station, should be extended to connect to the existing sidewalk Diamond Head of the gas station driveway. This sidewalk extension would provide a continuous pedestrian facility along that segment on N King Street and improve pedestrian connectivity and circulation. It is also recommended that the project ensure that all sidewalks surrounding the site on Pua Lane, N King Street, Liliha Street, and Vineyard Boulevard are wide (at least 6 feet wide), continuous, and in good quality (e.g. no cracking, free of obstructions, etc).

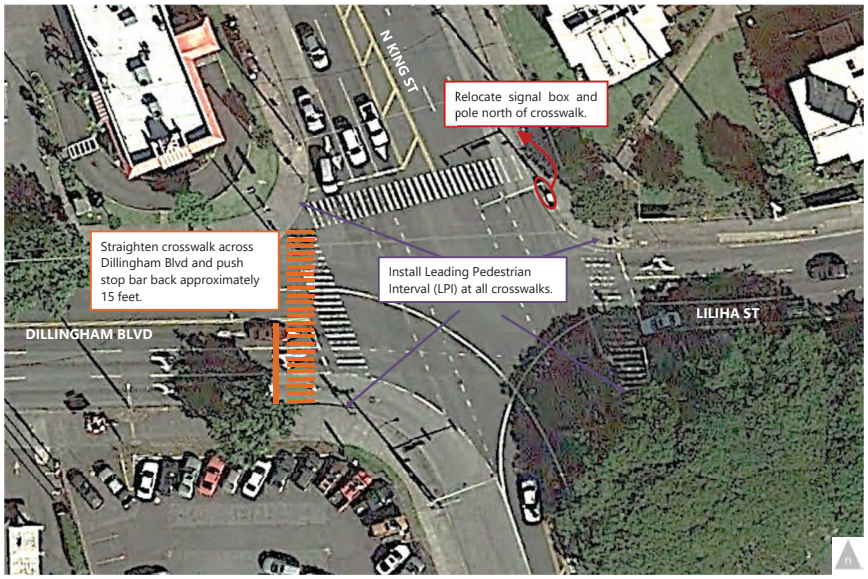


Figure 14
Pedestrian Safety Enhancements at N King St/Dillingham Blvd/Liliha St Intersection

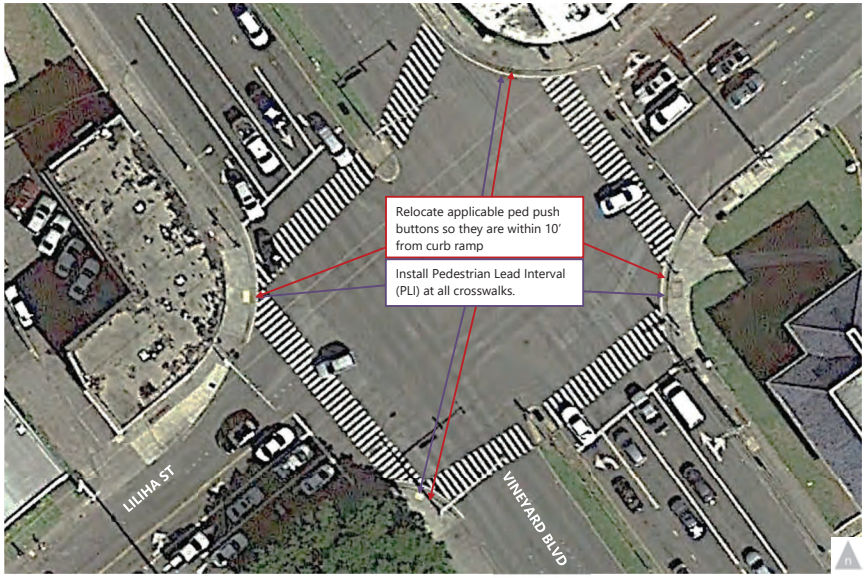

Figure 15

Pedestrian Safety Enhancements at Vineyard Blvd/Liliha St Intersection

11.1.3 BICYCLE NETWORK

The *O`ahu Bike Plan* (August 2012) plans for enhanced bicycle facilities to be implemented within the study area. The following are planned bicycle projects relevant to the project site and that would serve the study area:

- Bicycle lane on N King Street from Middle Street to River Street
- Bicycle lane on Liliha Street from N King Street to Wyllie Street
- Bicycle lane on Beretania Street from Alapa'i Street to N King Street
- Bicycle lane on Alakawa Street from Nimitz Highway to Dillingham Boulevard
- Bicycle route on Dillingham Boulevard from Pu'uhale Road to N King Street
- Bicycle path at the future Iwilei Transit Station from Dillingham Boulevard to Nimitz Highway

No additional designated bicycle paths or lanes are necessary as part of project implementation. The type and feasibility of bicycle facilities on facilities directly adjacent to the project site is currently being evaluated as part of complete streets projects being managed by the City & county of Honolulu Department of Transportation Services (DTS).

11.1.4 TRANSIT NETWORK

It is anticipated that the Honolulu Rail Transit system will start operating the initial section from Kapolei to Aloha Stadium in 2020, and the opening of the full system will be in 2025. The Iwilei Station will be located at Kaaahi Street and will serve the Kalihi and other outlying residential areas. The station will be located approximately 1,000 feet from the project site and will feature ADA pedestrian access, bicycle parking, and a Kiss-and-Ride. Current plans are for trains to operate between 4:00 AM and midnight daily, with five-minute headways during peak travel times and 10 minute headways during off-peak hours. To further enhance the multimodal facilities, it is recommended that the Developer relocate the bus stops on Liliha Street, immediately adjacent to the project site, onto the project property to reduce conflict with pedestrians and maximize the available sidewalk width.

Generally, the proposed project is not expected to substantially increase the walking, biking, or transit demand to a level where it could not be accommodated by existing or planned facilities. In addition, the project is expected to enhance multi-modal facilities and services, especially with the promotion of the use of passive and active spaces and non-motorized modes. The project is also expected to not conflict with any existing facilities and planned improvements. Thus, the project's impacts to pedestrian, bicycle, and transit facilities and services are therefore considered *less-than-significant*.
